## Sun Interception

Size of Canopy (K<sub>c</sub>)

Time of season (canopy expansion)

Spacing

Trellis

**ETo  
Reference ET**

A photograph of a weather station mast in a grassy field. The mast is made of light blue metal and has several components: a wind vane at the top, a small rectangular box in the middle, and a circular device near the base. The background shows a line of trees under a clear sky. A large, semi-transparent yellow banner with the text "ETo Reference ET" is overlaid on the bottom left of the image.

# Balance Vegetative/Reproductive Structure

# Vineyard Development

## Soil/Climate Resources

### ► Selection

- Rootstock
- Clone
- Spacing
- Trellis type

# Irrigation Management Philosophy

*Controlled water deficits*

*can improve fruit quality*

*with little effect on yield*

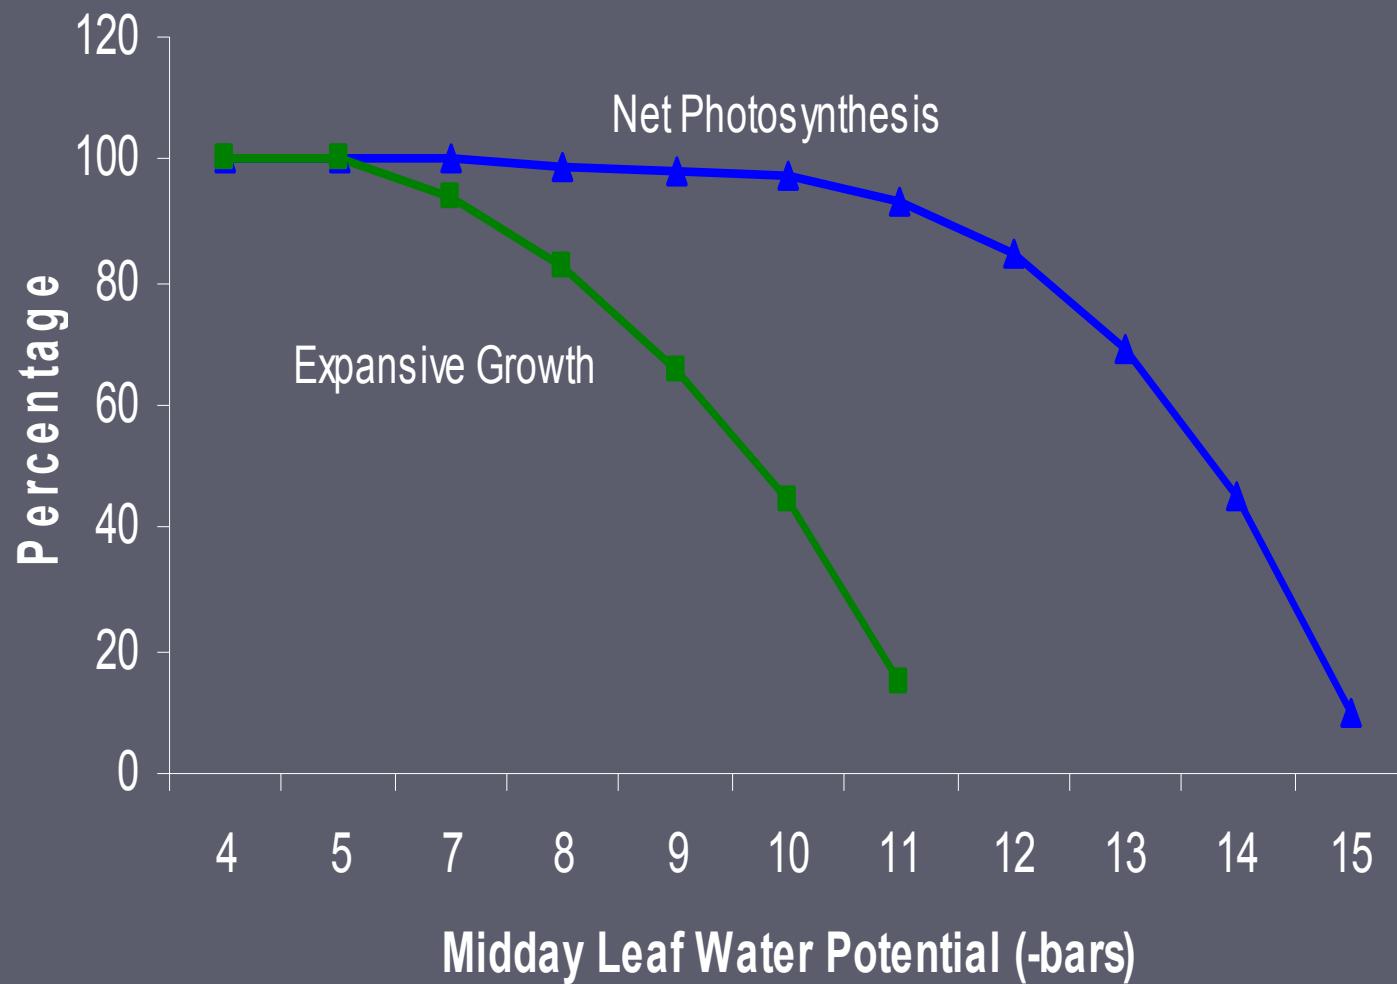

# Moderate Water Deficits

► Reduce vegetative growth

- Shoot length
- No. of lateral shoots

Increase diffused light to fruit

# Relative Rate vs. Leaf Water Potential

# Quality Goals

- ▶ Titratable acidity *Extractable*
- ▶ Tartaric/Malic ratio *Extractable*
- ▶ pH
- ▶ Potassium ▶ Phenolics
- ▶ Tannins

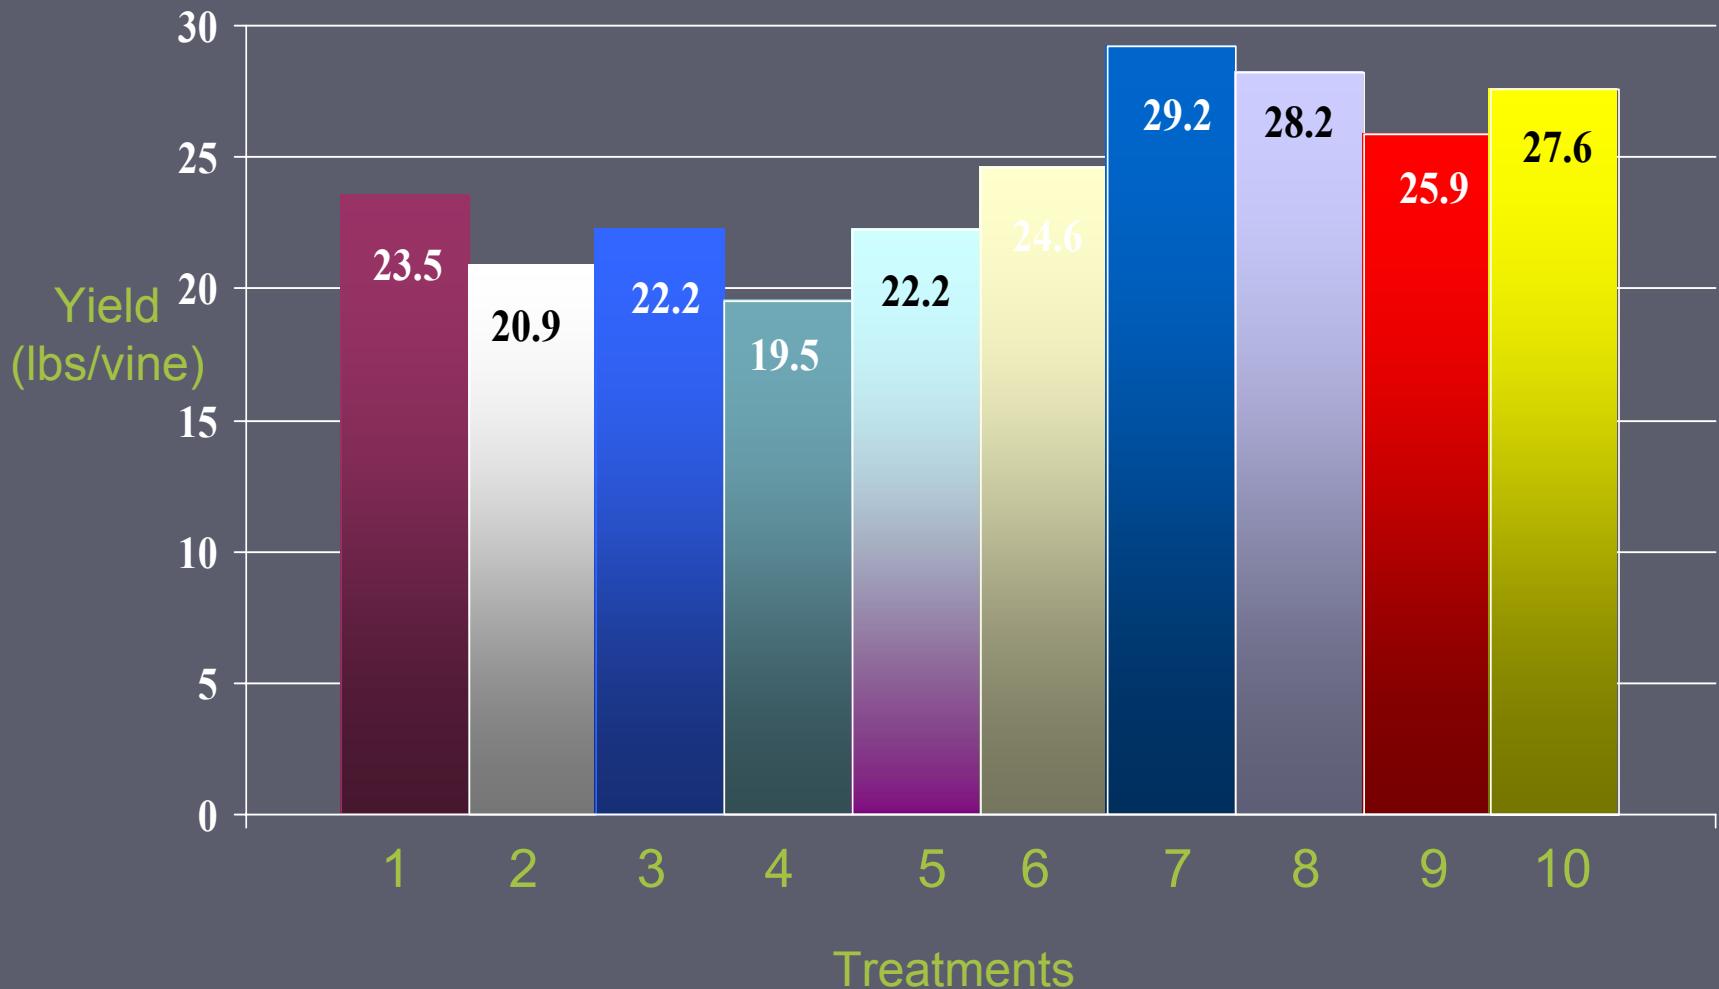

# Cabernet Sauvignon, 2000

| Location | Tons per acre | Yield:<br>Prun wt | Soluble solids<br>(°Brix) | Titratable acidity<br>(g/L) | pH  | Anthocyanins<br>(mg g <sup>-1</sup> FW) |
|----------|---------------|-------------------|---------------------------|-----------------------------|-----|---|
| Parlier  | ~9            | 9.1               | 22.8                      | 5.4                         | 4.2 | 7.9                                     |
| Lodi     | ~8            | 11.3              | 23.4                      | 8.1                         | 3.7 | 18.2                                    |
| Oakville | ~6            | 6.5               | 23.9                      | 6.7                         | 3.9 | 27.5                                    |

# Cabernet Deficit Irrigation

| Variable   | % of ETc            |    |     |
|------------|---------------------|----|-----|
| Berry Size | 50                  | 75 | 100 |
|            | % of 100% Treatment |    |     |
|            | 80                  | 90 | 100 |

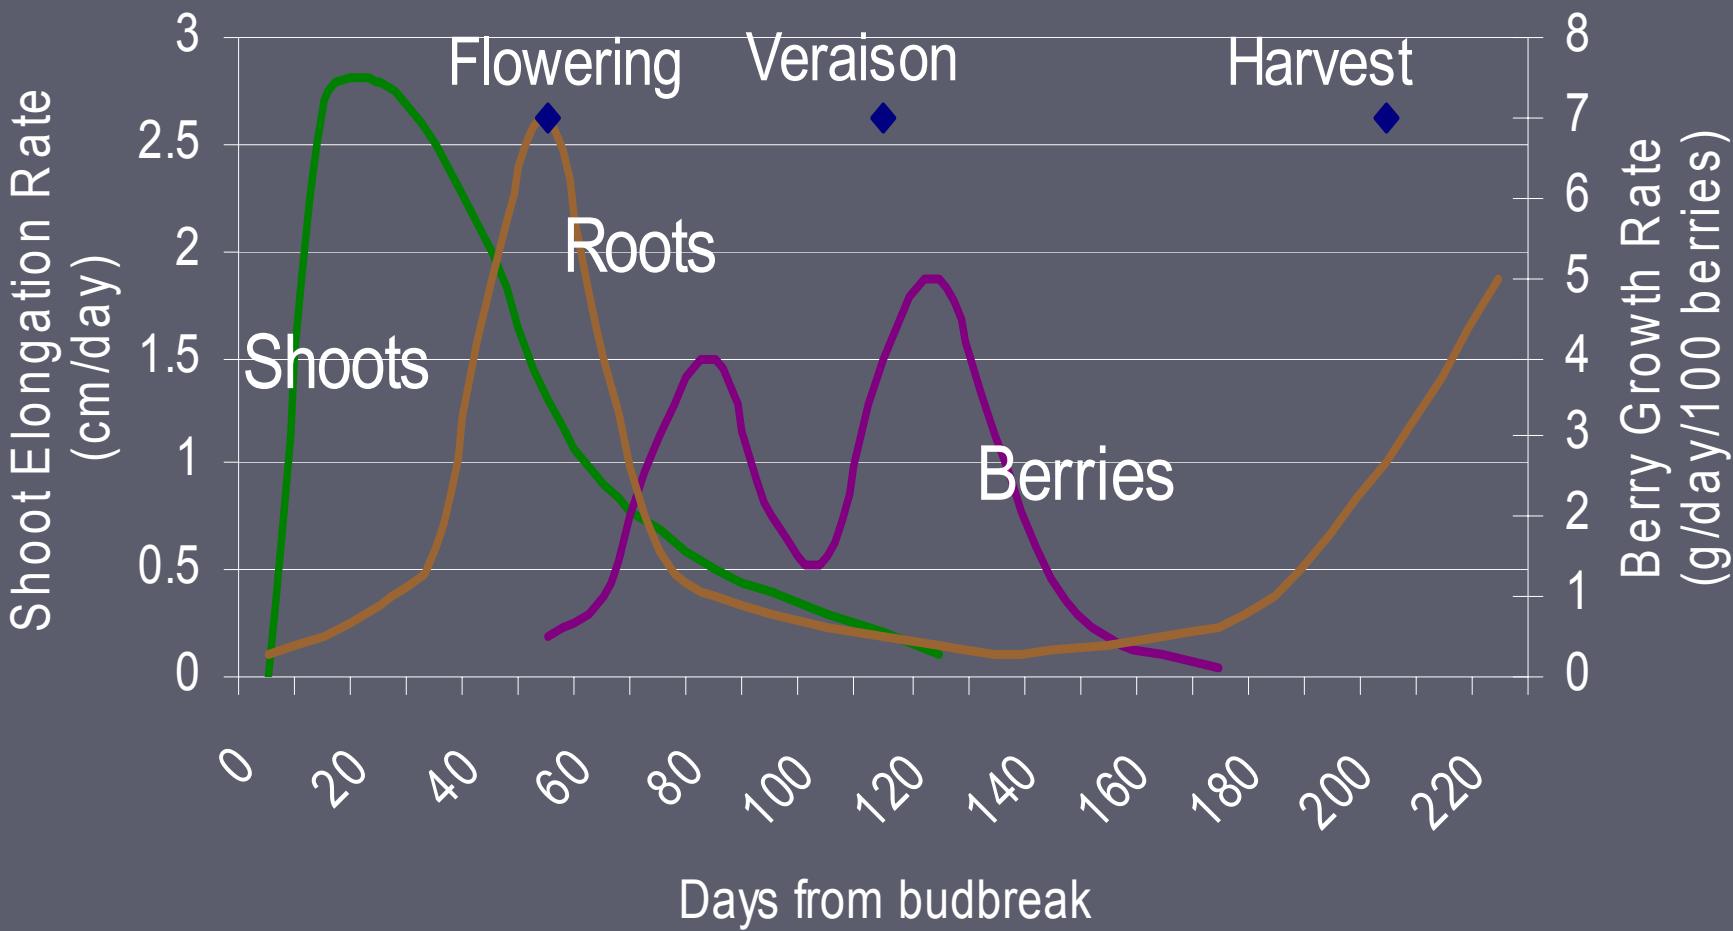

# Lodi Merlot 1998

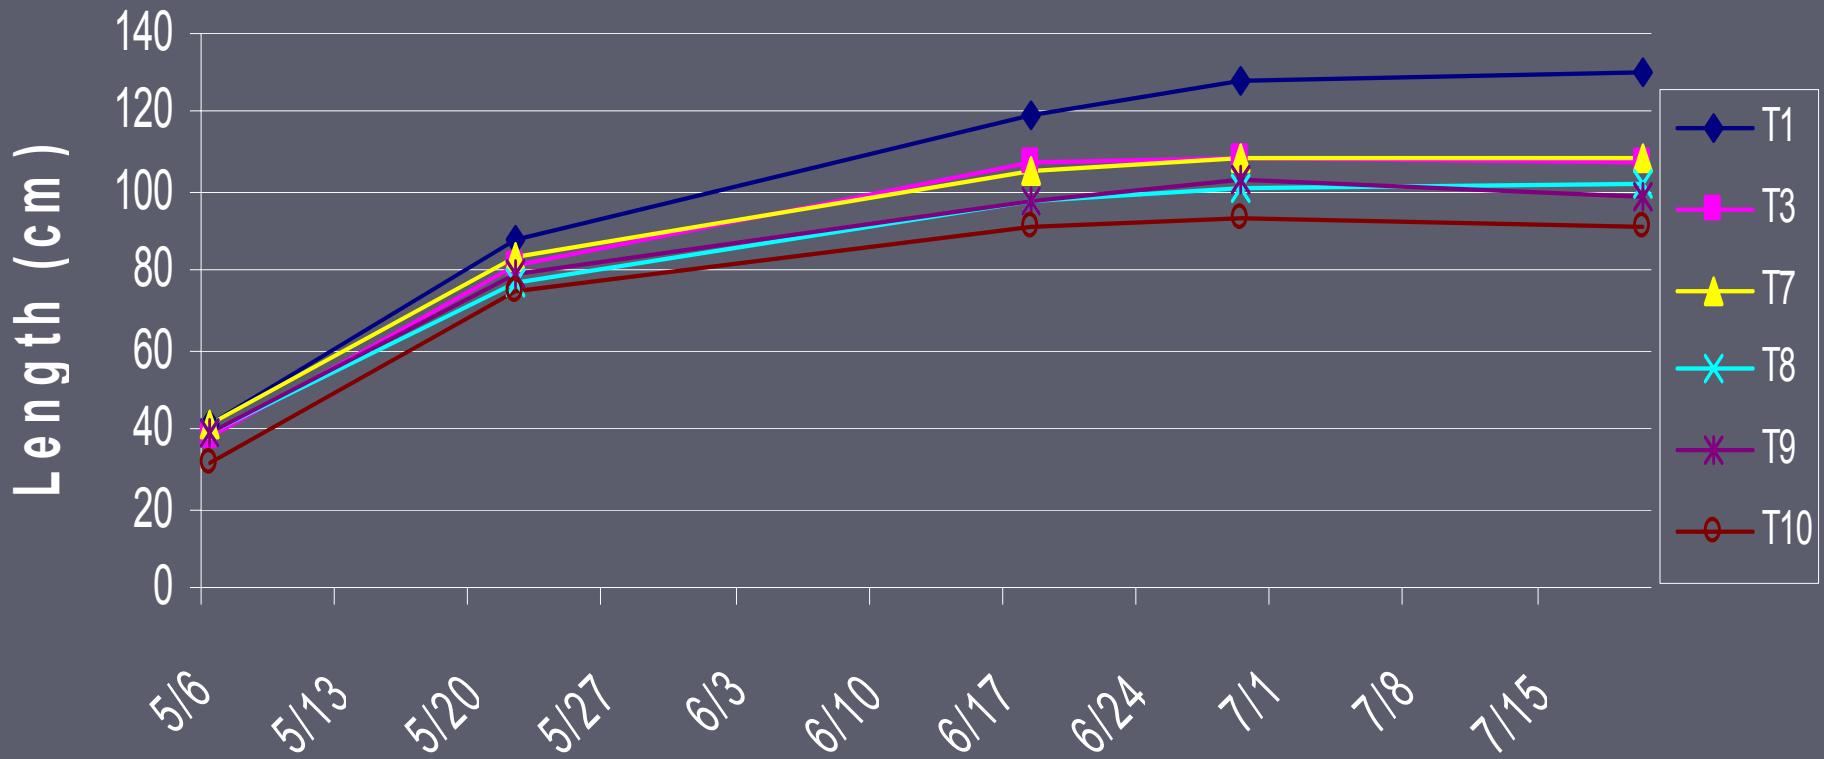

# Shoot, Root, and Berry Growth Rate

Mullins, 1992

# Shoot Growth, Merlot, Lodi, 1999

# Irrigation of Quality Winegrapes

- ▶ Determine
  - When
  - How much
- ▶ Achieve a predictable response

# Developing a Strategy

*To Accomplish the Set Goal*

*Fruit quality/yield*

- ▶ When to Begin Irrigation
- ▶ How much to Apply

# When to Begin Irrigation

- ▶ Shoot Growth
- ▶ Tip Rating
- ▶ Mid day Leaf Water Potential
- ▶ Soil Based Monitoring Decision

# Soil Moisture Measurement

- ▶ Quantitative (quantity)
- ▶ Qualitative (status)

# Quantitative Moisture Measurement Methods

- ▶ Gravimetric / Volumetric Soil Sampling
- ▶ Neutron Moisture Meter
- ▶ Dielectric Moisture Sensors
  - Capacitance Probes
  - Frequency Domain Reflectometry (FDR)

# Diurnal Leaf Water Potential

# Leaf Water Potential, Lodi Merlot

## 6/11/99

# Pressure Bomb

- ▶ When to sample (solar noon +- 1.5 hr.)
- ▶ No. of vines/block (6 average vines)
- ▶ No. of leaves (2/vine)
- ▶ Leaf selection (young/fully expanded)
- ▶ Leaf bagging (before excising)
- ▶ Rate of pressure increase (3 sec/bar)
- ▶ Leaf care (breaking veins)

# Deficit Threshold + RDI

- ▶ Begin irrigation at a specific leaf water potential “threshold”
- ▶ After threshold, irrigate at fraction of full water use

# When to Begin Irrigation

Deficit threshold method

leaf water potential threshold

-10 to -14 bars

# Leaf Water Potential

## Selecting a Threshold

Enough to Stop Vegetative Growth

-12

-13

-14

-15

Variety, Wine Goal, Region

# How Much Water

Deficit threshold method

After threshold, a fraction of full  
vine water use

Full vine water use  $\times$  RDI %

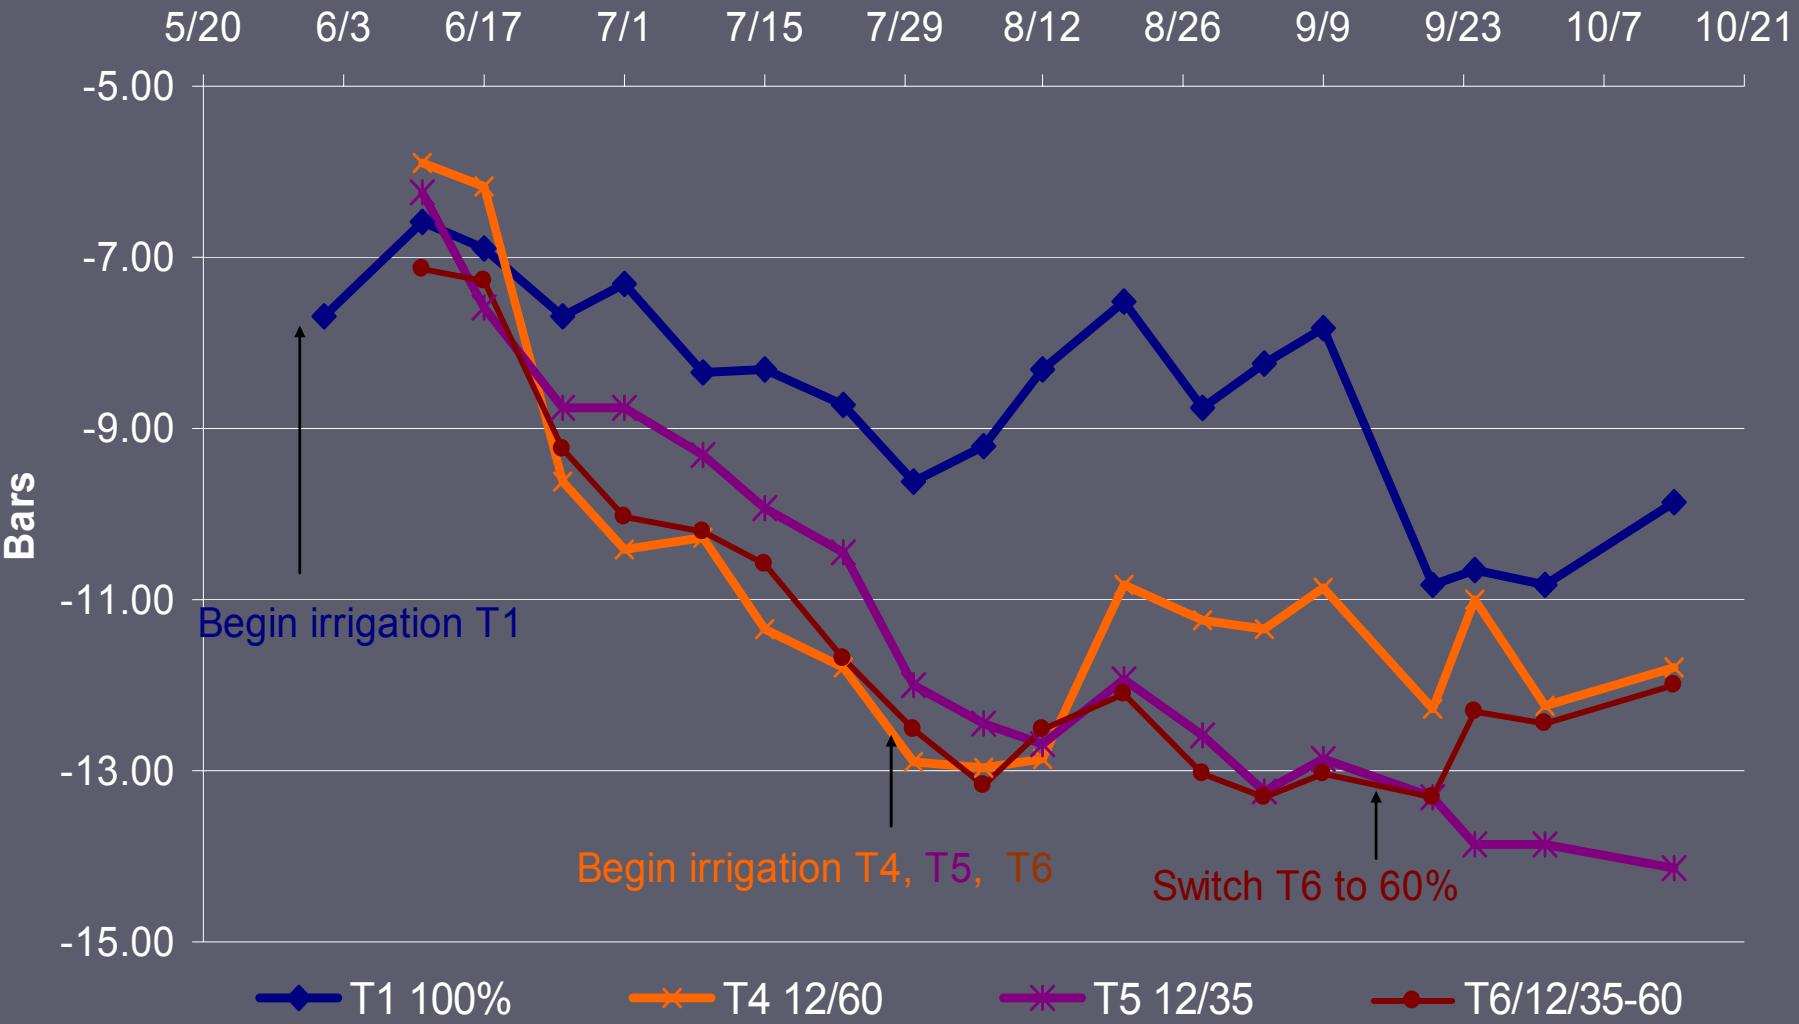

Rdi % --- 35 - 60%

# How Much Water to Apply

- ▶ Volume of water to apply
  - Gallons per vine per week
- ▶ Not restart vegetative growth
- ▶ Continue Sugar accumulation (Photosynthesis)
- ▶ Protect fruit (cover)

# Midday Leaf Water Potential

## 2000 Cabernet, Hopland

# Determining the Irrigation Volume

$ETo \times Kc =$

Full Potential Vine Water Use (Etc)

$ETc \times RDI\% =$  Net Water Volume Needed

Net Irrigation X Emission Uniformity =  
Gross Irrigation Volume

# Madera 2002

## Eto and precipitation from 2002

# Monitor Effects of Strategy

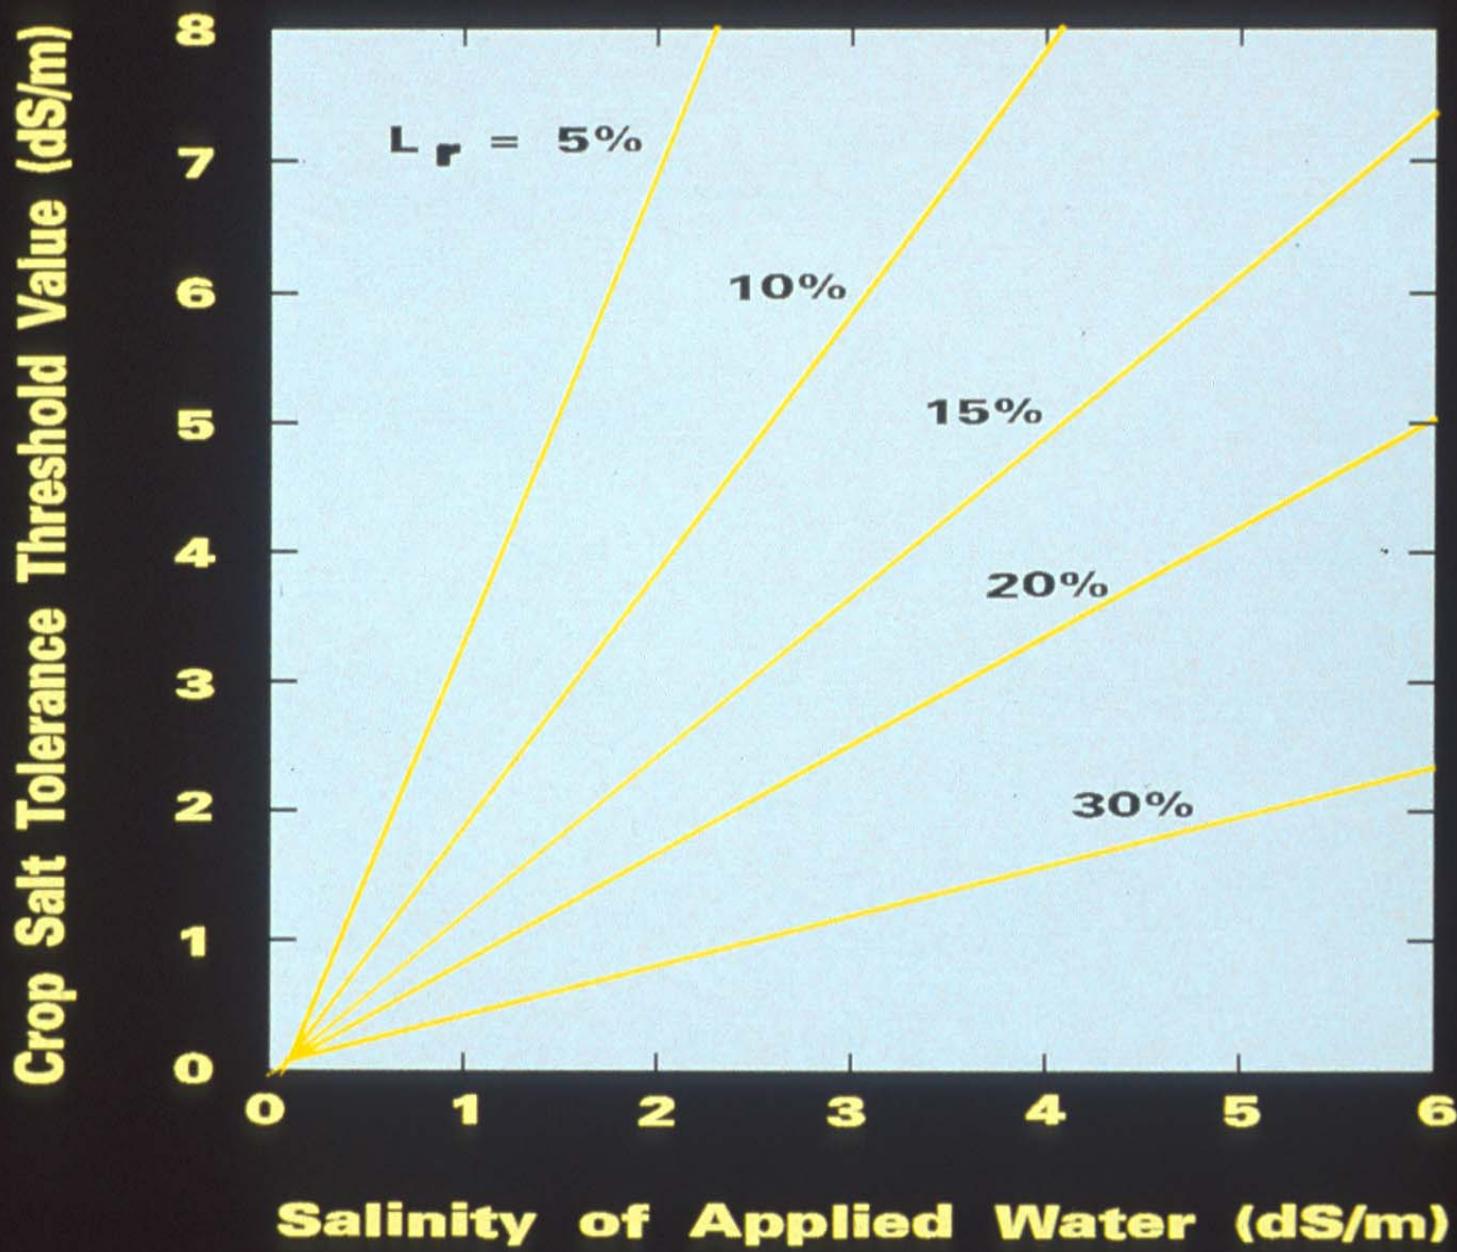

- Leaf Water Potential
- Vegetative Growth
- Yield
- Quality
- Winemaker Comments

A close-up photograph of a grapevine branch. The branch is heavily laden with clusters of dark purple grapes. Interspersed among the grapes are large, deeply lobed leaves that are mostly healthy green color. However, there are several large, irregularly shaped, yellowish-brown, shriveled, and papery-looking leaf structures, which are characteristic of grapevine blight or similar foliage diseases. These diseased leaves are particularly prominent on the left side of the frame.

**Severe Deficit  
Loss of Leaf Cover**
