Willamette spider mite: *Eotetranychus willamettei* Ewing

During the summer of 2007 a trial was conducted near Arvin, Kern Co., CA to determine the effects of miticides on the density of Willamette spider mite in grapes. A 1.7 acre portion of a mature vineyard was divided into 75 plots, each 4 rows by 10 vines long. Plots were organized into a RCBD with 5 blocks of 14 treatments and an untreated check. Treatments were applied at 200 gpa on 15 Jun 2007 using an air-blast sprayer. Mite populations were evaluated on 14 Jun (pre-counts), and 6, 13, 20, 27, 34, 41, 48, 55, and 62 DAT. On each evaluation date, 10 leaves from the inside and outside of the canopy were collected, taken to a laboratory and processed through a mite brush, and then evaluated under magnification to determine the total number of Willamette spider mite motiles (juveniles + adults) and eggs. Data for each plot were converted into average Willamette spider mite motiles per leaf and average Willamette spider mite eggs per leaf, and were analyzed by ANOVA using transformed data (square root ($x + 0.5$)) with means separated by Fisher's Protected LSD ($P = 0.05$).

All miticide treatments provided significant reductions in mite density on at least one evaluation date compared to the untreated check. Of these treatments Fujimite, Onager and Apollo provided the best overall control, with mite densities for the duration of the trial never exceeding 1.0 per leaf (Table 1). This was followed by both Enidor treatments, Zeal, Vendex, Brigade and Acramite, that with only minor exceptions resulted in mite densities higher than, but statistically equivalent to the top three treatments. The four abamectin treatments (Agri-Mek, Reaper, Zoro and ABBA) resulted in significant reductions in mite densities compared to the untreated check through 35 DAT for Zoro, and through 42 DAT for the other three products. Plots treated with abamectin products had comparable pest densities to the untreated check for the final 4 weeks of the trial. Ecotrol resulted in no consistent reductions in mite densities.

Data on the density of spider mite eggs paralleled trends for motile spider mites (Table 2).
