Lake Tahoe Watershed Assessment: Volume I

**THE LAKE TAHOE WATERSHED:
TYPICAL OF ALL CALIFORNIAN MOUNTAINS**

THE NATURAL SETTING:

- **GRANITIC SUBSTRATE, 6,000-10,000 FT. ELEV. RANGE**
 - **MEDITERRANEAN CLIMATE, SUMMER STRESSES**
- **MIXED CONIFER , TRUE FIR, & SUBALPINE FORESTS
IN OLD-GROWTH AND MID-SUCCESSION STATUS**
- **WETLANDS WITH MEADOWS & RIPARIAN FOREST**
 - **DRY SLOPES WITH MONTANE CHAPARRAL**

MANAGEMENT ISSUES:

**FIRE SUPPRESSION HISTORY---> FIRE & DISEASE
HARVEST VS CONSERVATION CONSTRAINTS
RECREATION ACCESS AND IMPACTS
SUBURBAN ENCROACHMENT
WATER POLLUTION
AIR POLLUTION**

Fire suppression and the lack of forest thinning have led to dense, overgrown forests throughout the Sierra Nevada and Lake Tahoe Basin.

Although highly variable across the stand, downed and dead fuel loading now commonly exceeds 535,000 pounds per acre in some locations.

The table below depicts the long-term trends in Primary Productivity (Reuter, 2000). The recovery of low Primary Productivity values following the Comstock era disturbance (extremely high soil erosion due to deforestation in the Tahoe Basin) indicates that Lake Tahoe may recover from the current high Primary Productivity if proper controls are instituted in a timely fashion.

Era	Time Period	Value*
Before Comstock Logging	up to 1861	27
Comstock Logging	1861-1898	176
Post Comstock Logging	1900-1969	29
Modern Urbanization	1970-1991	95
Current	1991-	160+ (5-6% increase/year)

* Primary Productivity in Lake Tahoe ($\text{g C m}^{-2} \text{y}^{-1}$)

WHAT IS THE RECONSTRUCTION OF PRE-CONTACT MIXED-CONIFER OLD-GROWTH FOREST?

- **SURFACE FIRE REGIME:**
**SLOW MOVING, MODERATE FLAME LENGTH, COOL-
HOT BURNING; HOT ENOUGH TO KILL 30-60% OF
UNDERSTORY TREES 10-20 CM DBH;
OVERSTORY TREES <10% MORTALITY
BUT LOCALLY SCARRED;
FIRE RETURN INTERVAL = 50 YR;
AVERAGE SIZE OF SINGLE FIRE (MODE) = <15 HA**

- **TREE DENSITY/HA = 110**

- **SAPLING:TREE DENSITY RATIO = 3:1**

AGE (SIZE) DISTRIBUTION = FLAT

- **PINE:FIR RATIO = 1**

- **SHRUB + HERB COVER = 10%**

- **STANDING DEAD TREES = 5-15%**

- **DISEASE INCIDENCE (SPM) = 12%**

- **COARSE WOODY DEBRIS BIOMASS = ?**

**General Land Office
Survey Data
1861 to 1897**

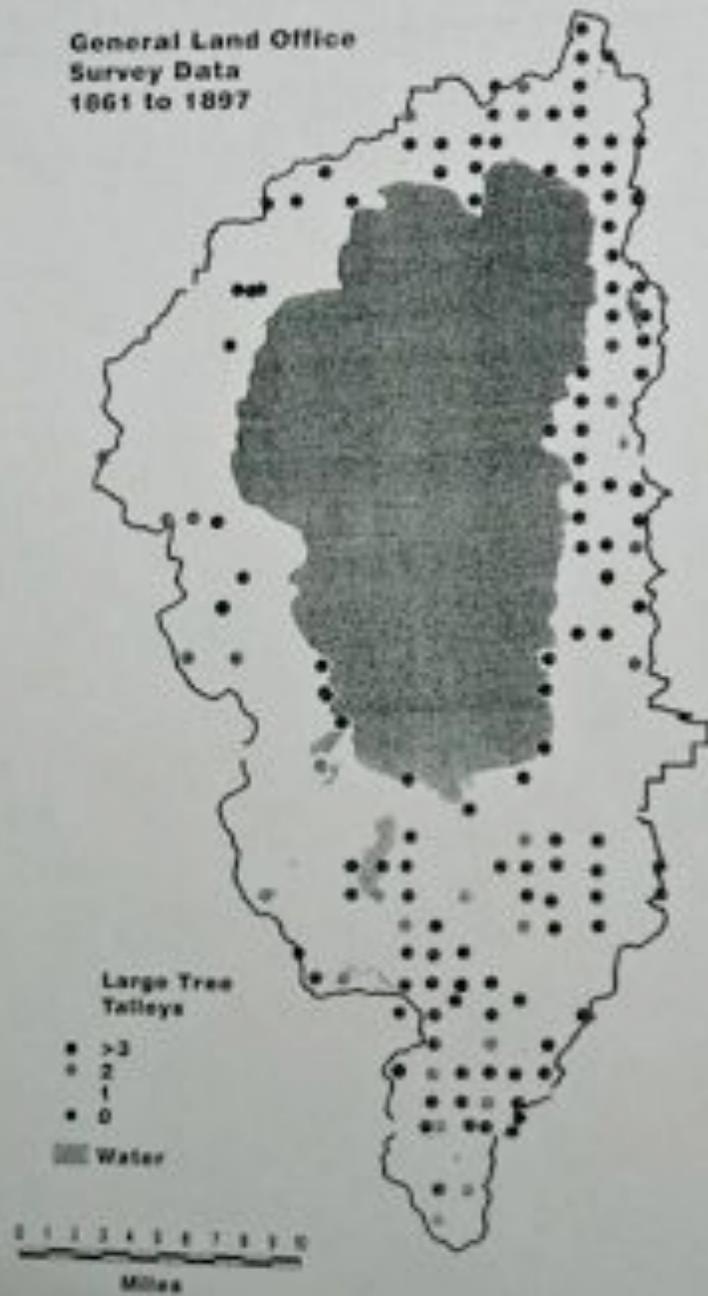

Figure 5-1—Location of areas surveyed by the General Land Office from 1861 to 1897. Data show survey points at which the number of large trees was counted.

Figure x. Species composition in late 1800's in montane zone (<7,000' elevation) based upon tally of trees at section corners.

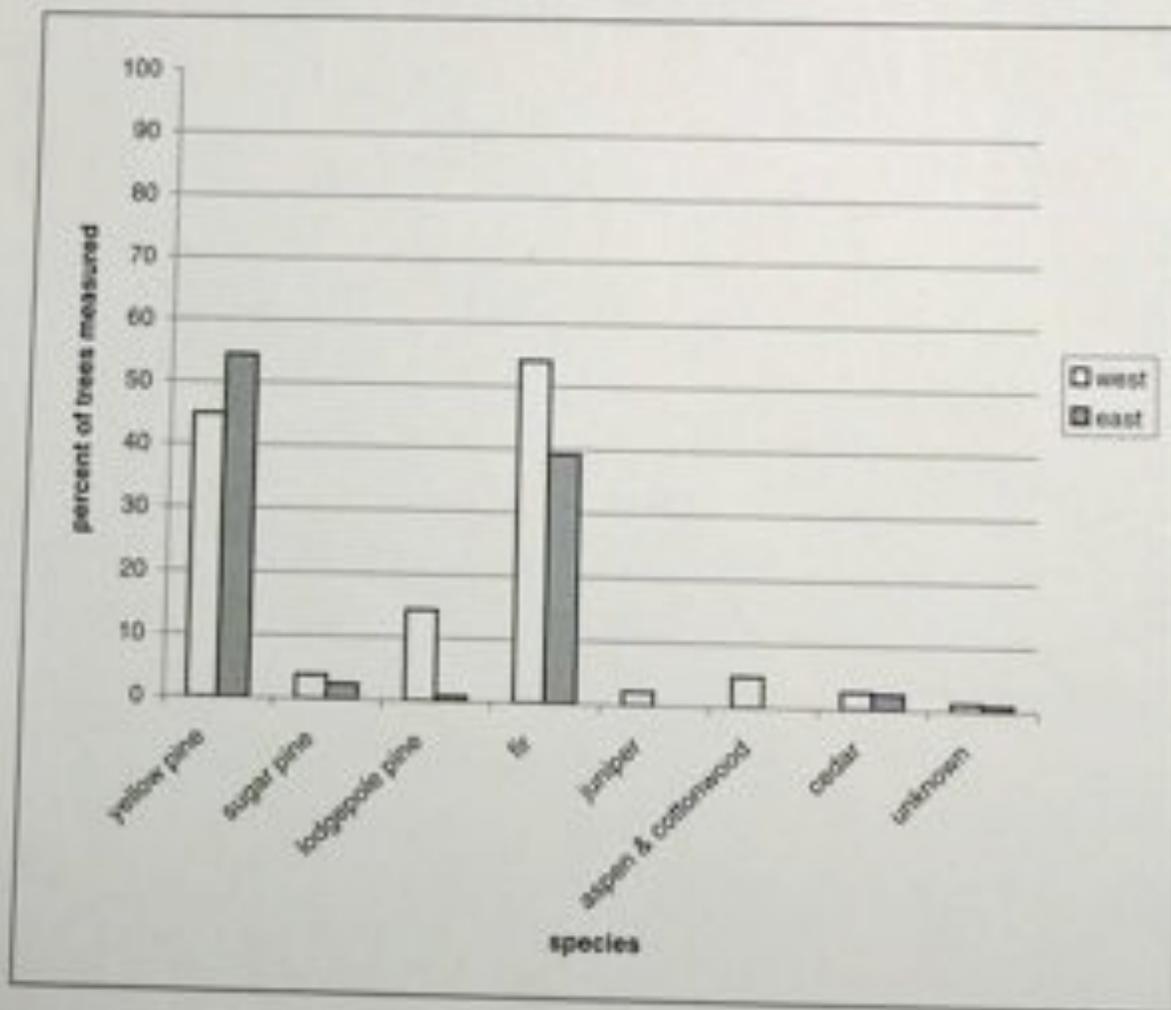

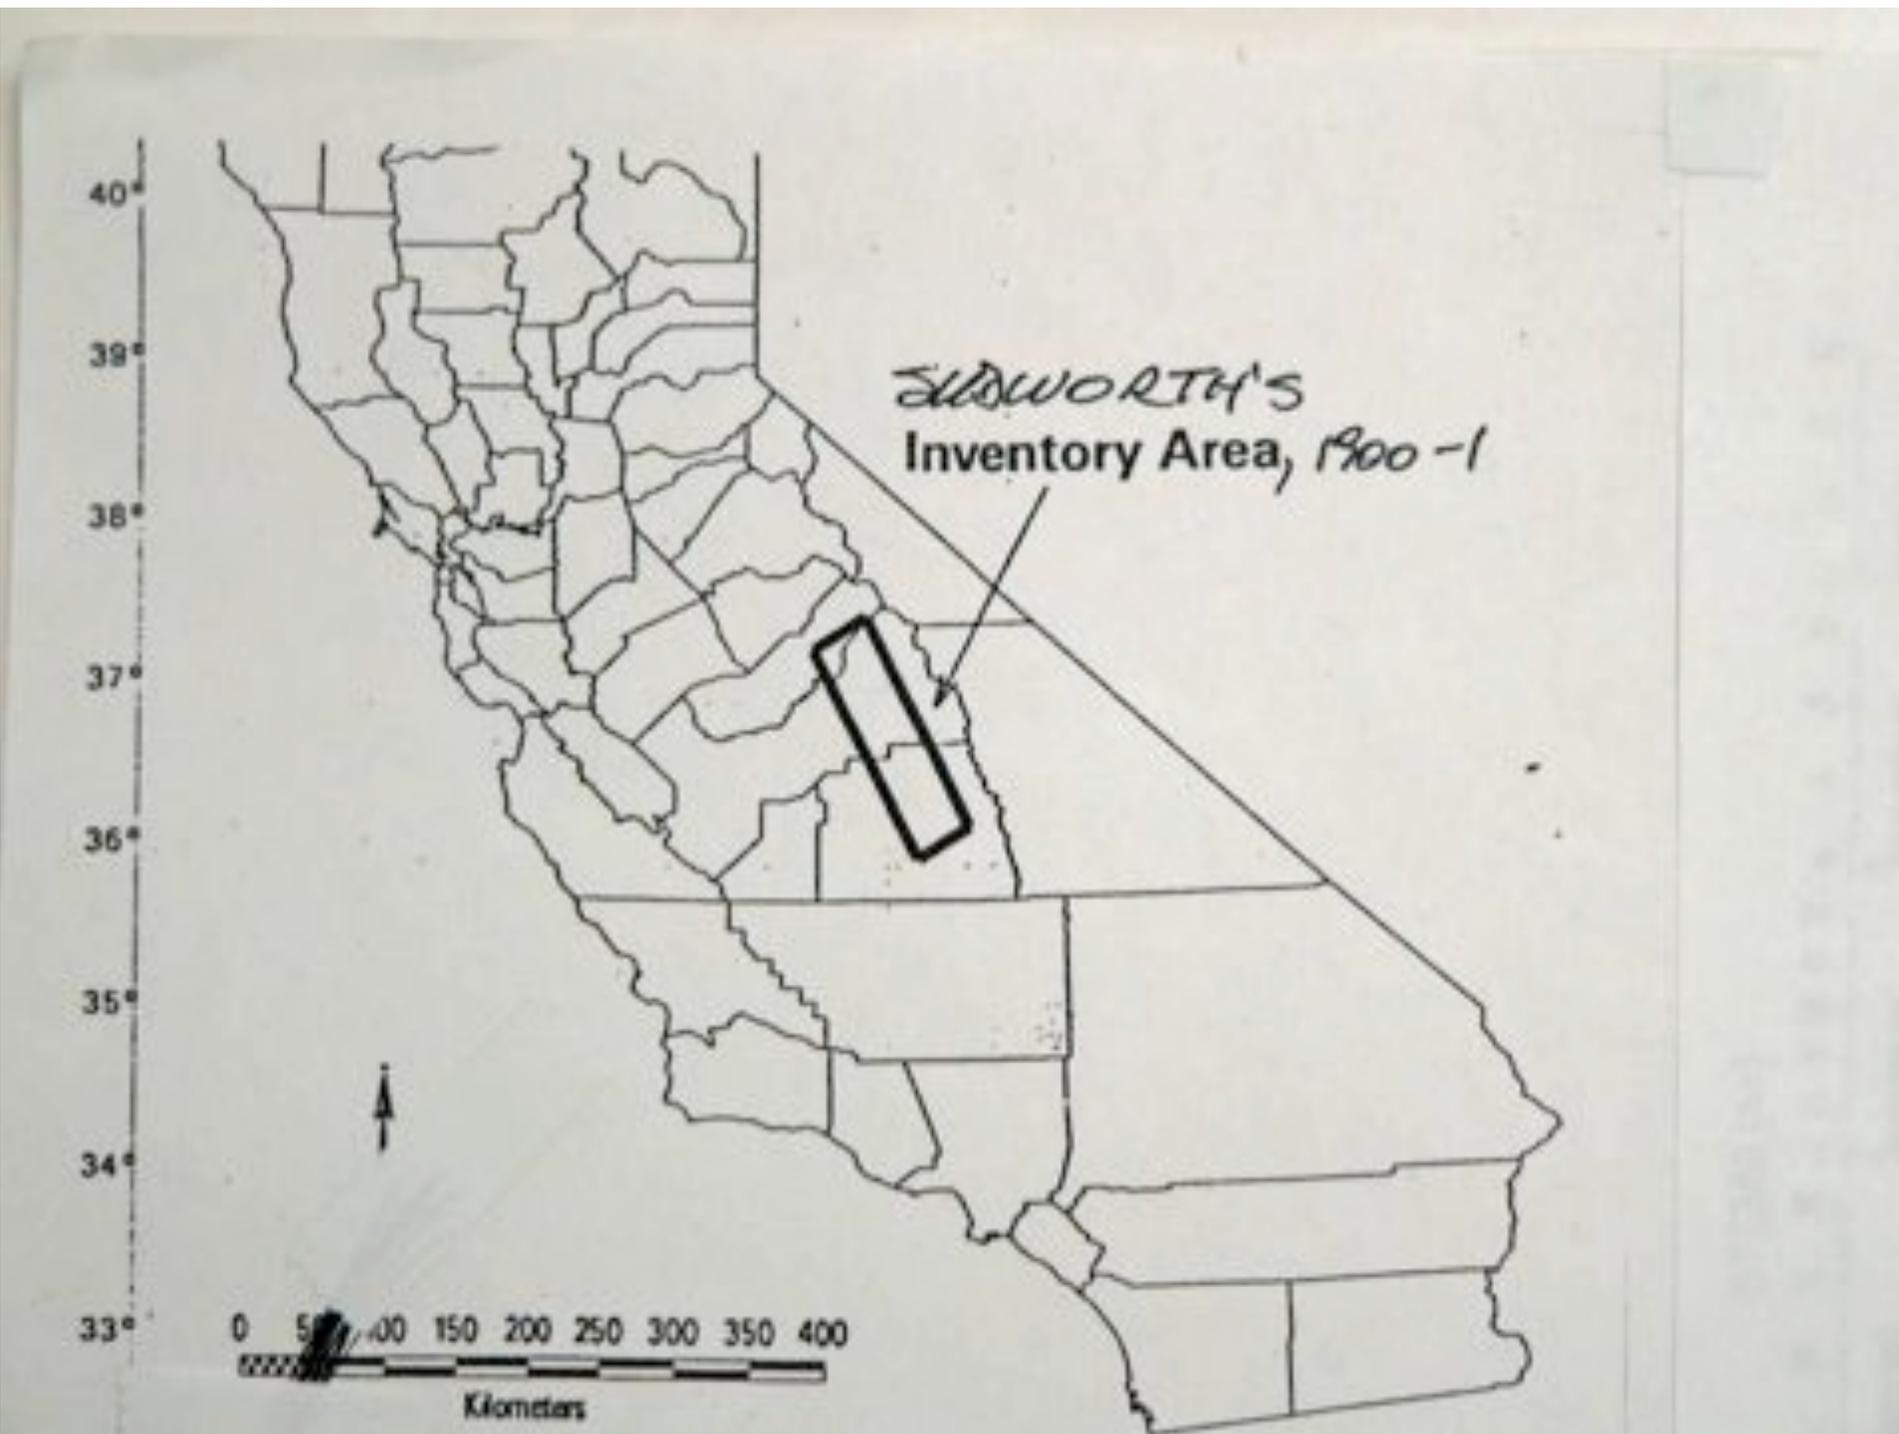

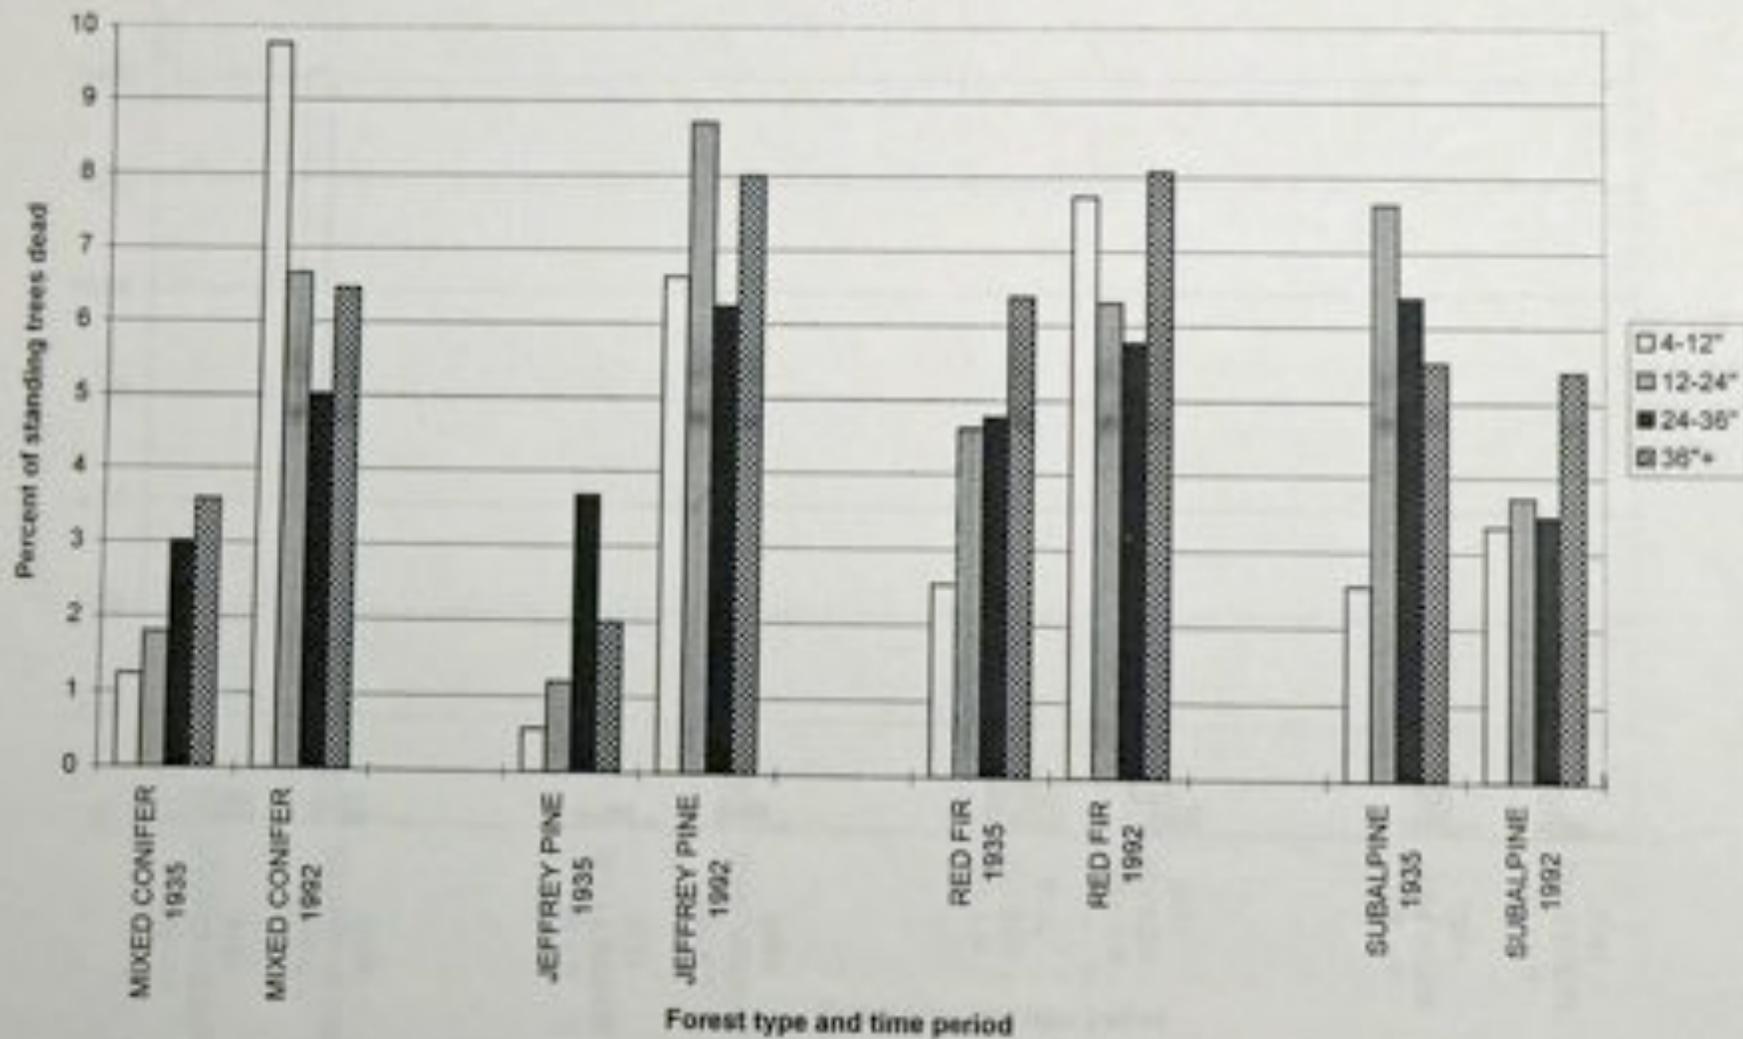

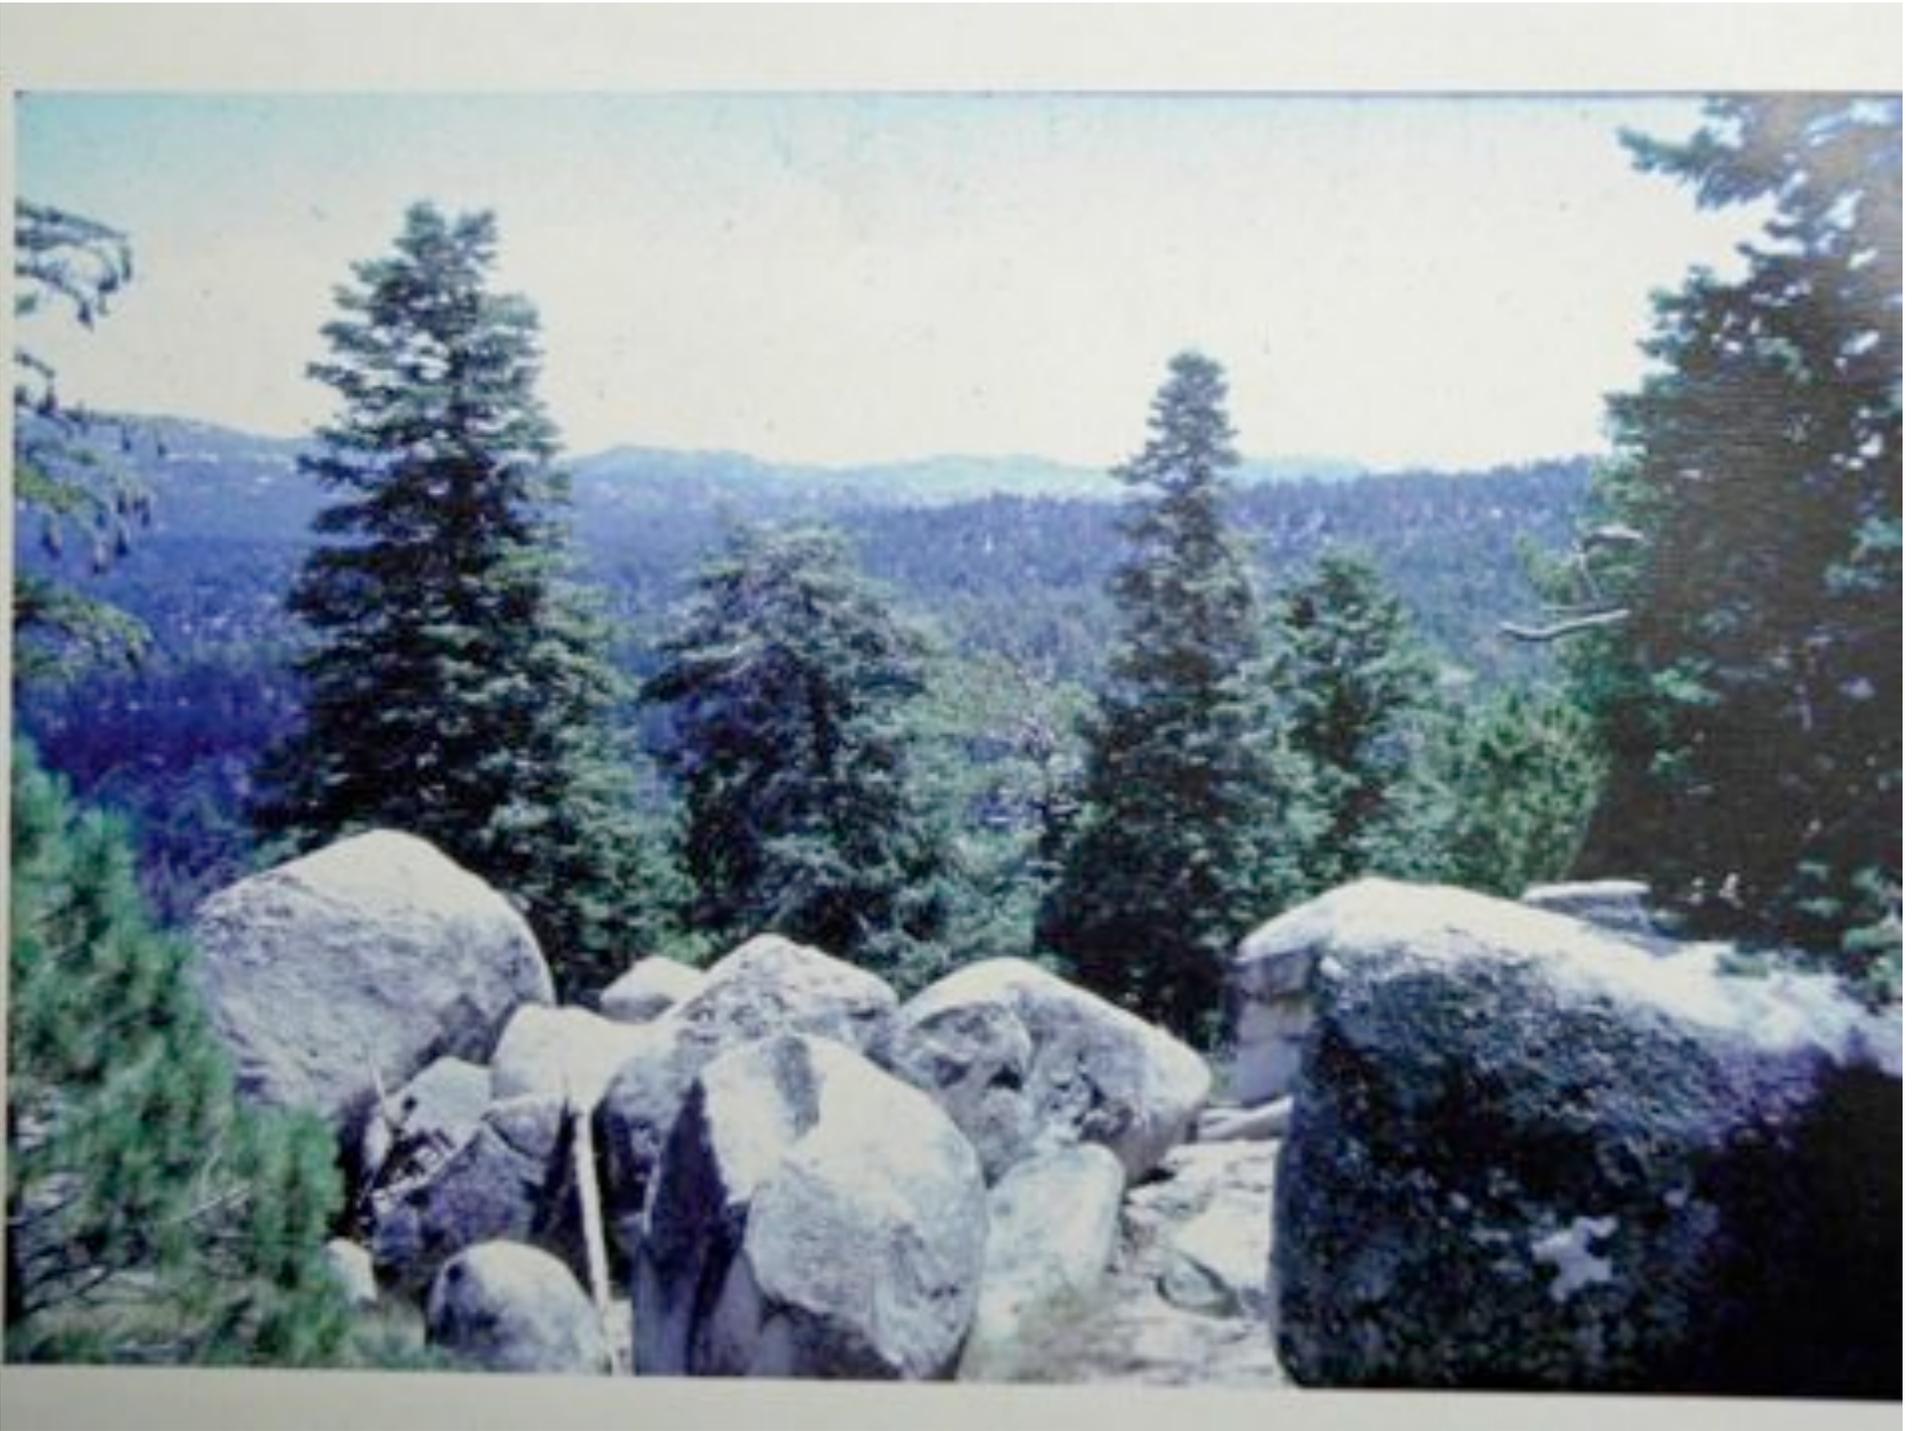

FIG. 1. Forest conditions in the study area in 1876 at Spooner Summit, on the east shore of Lake Tahoe, Carson Range, Nevada, USA (photo by C. E. Watkins; published with permission of the Nevada Historical Society). Note the near-clearcut logging of the forest and the presence of cut stumps that served as the basis for the presettlement-forest reference reconstruction.

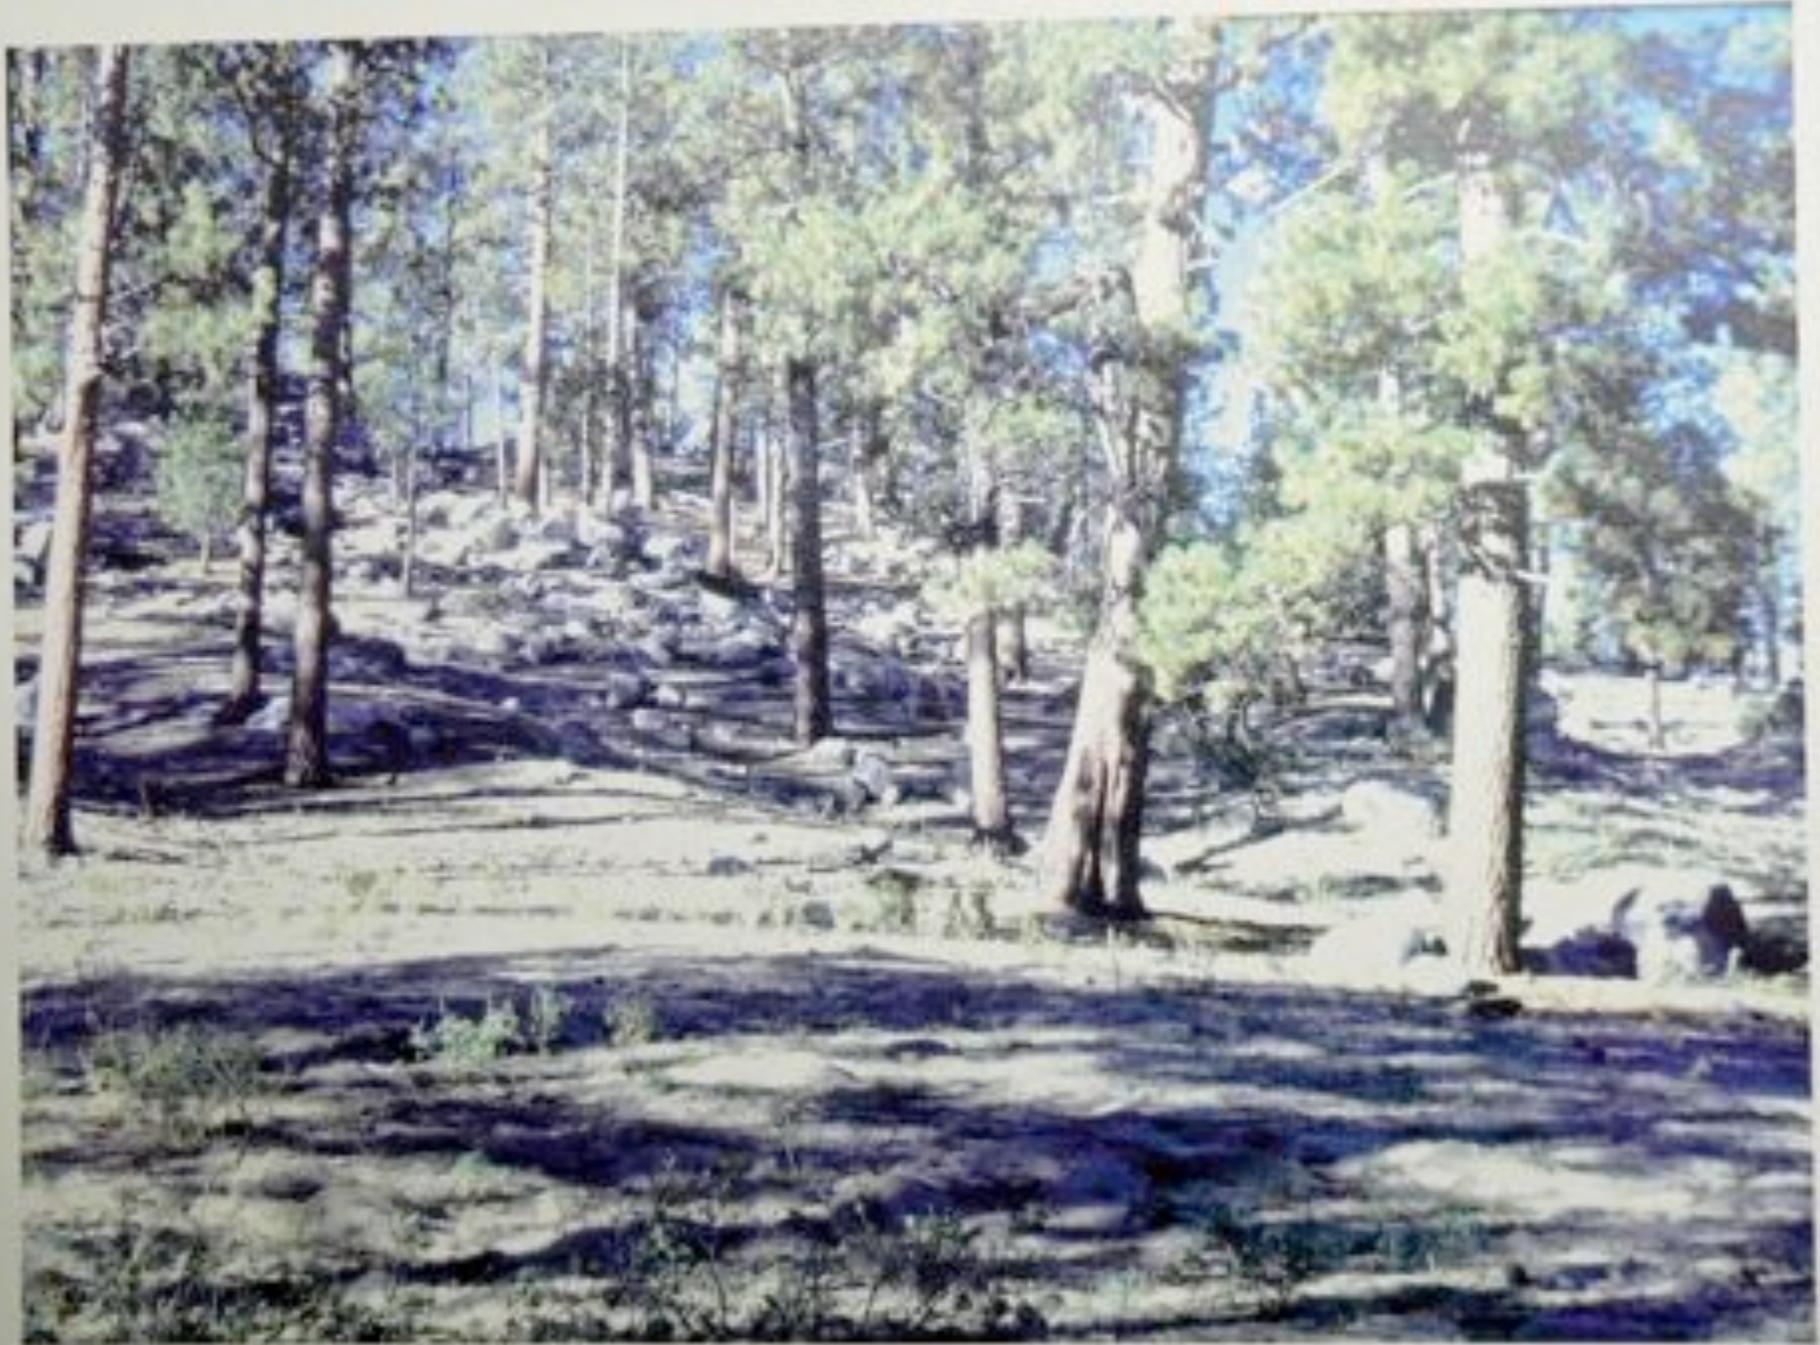

CHANGES IN PERCENT MORTALITY AS A FUNCTION OF TIME, SIZE CLASS AND FOREST TYPE

WHAT IS THE MODERN OLD-GROWTH MIXED-CONIFER FOREST LIKE?

**(SOURCES: PINERY, EMPIRE CREEK, SAILOR BASIN,
PLACER COUNTY BIG TREES, TAHOE BASIN, ASPEN
VALLEY, TEAKETTLE EXPERIMENTAL FOREST, FIA PLOTS)**

**• SURFACE FIRE REGIME:
FIRE RETURN INTERVAL = >600 YR
POTENTIAL FOR CATASTROPHIC CROWN FIRE
VERY HIGH; UNSTABLE ECOSYSTEM**

- TREE DENSITY/HA = 530**
- SAPLING:TREE DENSITY RATIO = 1.5:1**
- AGE (SIZE) DISTRIBUTION = NEG EXP**
 - SHRUB + HERB COVER = 10%**
 - STANDING DEAD TREES = 20-25%**
 - DISEASE INCIDENCE (TAHOE) = >20%**
 - COARSE WOODY DEBRIS BIOMASS = 27
(METRIC TONS PER HA)**

**SUGGESTED MINIMUM CRITERIA
FOR OLD-GROWTH STATUS
IN THE TAHOE BASIN**

- >5 snags of >76 cm dbh/ha**
- >10 living trees > 76 cm dbh**
- >25 living trees >40 cm dbh**
- >40% canopy cover**
- <400 trees >1 cm dbh (except white fir)**
- <625 such trees for white fir forest**
- <35% cover by shrubs + herbs**
- <10% live trees with disease symptoms**
- <20% of all trees dead**
- *Maximum kg/ha annual litter drop**
- *A particular range or ratio of
[C, N, P] in litter or topsoil**
- *Presence (or minimum abundance)
of certain groups of soil microbes**

***data still being analyzed**

IMPACT OF NATIVE CALIFORNIANS

**WERE NATIVE CALIFORNIAN TECHNOLOGIES
CAPABLE OF CREATING WIDESPREAD
ECOLOGICAL CHANGE?**

YES (FIRE)

**WERE SETTLEMENTS OF ADEQUATE
DURATION TO CAUSE PERMANENT EFFECTS
ON THE LANDSCAPE?**

YES (9000-10,000+ YR)

**WAS POPULATION DENSE ENOUGH TO HAVE
WIDESPREAD ECOLOGICAL IMPACTS?**

**PROBABLY (90,000-100,000 INDIVIDUALS,
3000 PERMANENT SETTLEMENTS, 5000
SEASONAL SETTLEMENTS EACH AFFECT-
ING 3 SQUARE MILES)**

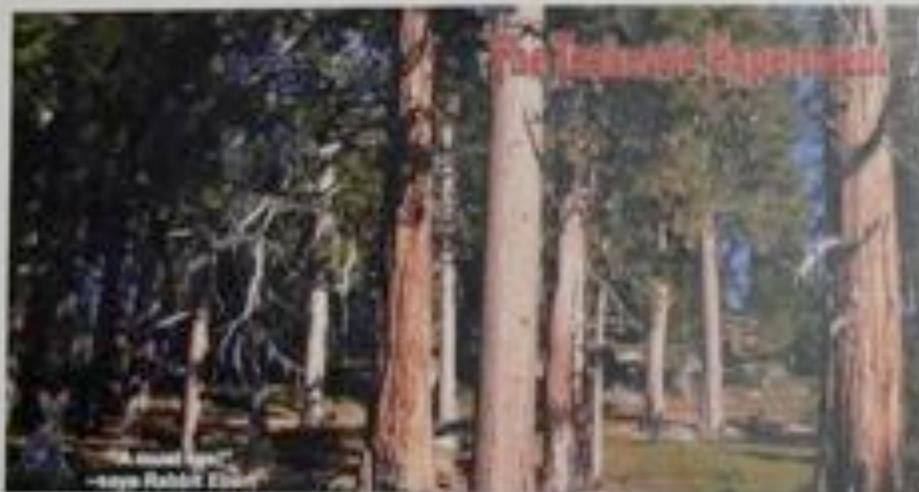

**WHICH ACTIVITIES HAD THE GREATEST
IMPACT ON THE LANDSCAPE?**

BASKETRY, CORDAGE, FIREWOOD, FOOD

PLANT MATERIALS NEEDED PER ITEM

FILM SCREENING

THE TEAKETTLE EXPERIMENT

Executive Producer: Malcolm North

"Starring" UC Davis research by:

Michael Barbour, Rob Fiegeler, Matt Horteau, Doug Keil, Patricia Maloney, Marc Meyer, Malcolm North, Tom Rambo, David Rizzo, Tom Smith, and Rebecca Wayman.

FRIDAY, MAY 11, NOON TO 1:00 PM

THE BARN, LARGE CONFERENCE ROOM

Forest "health" cannot be restored through thinning alone. This documentary summarizes ten-years of collaboration between forest managers and scientists from multiple disciplines to prove the benefits of prescribed burning as the essential means for restoring fire-suppressed forests. This documentary has increased awareness that overcrowded forests are subject to disease, pests and catastrophic wildfires.

Teakettle project director Malcolm North, Department of Plant Sciences, USDA Forest Service Sierra Nevada Research Center, is offering FREE copies of this interactive DVD at the screening, which will conclude with a Q & A on forest management and outreach.

Screening sponsored by the John Muir Institute of the Environment

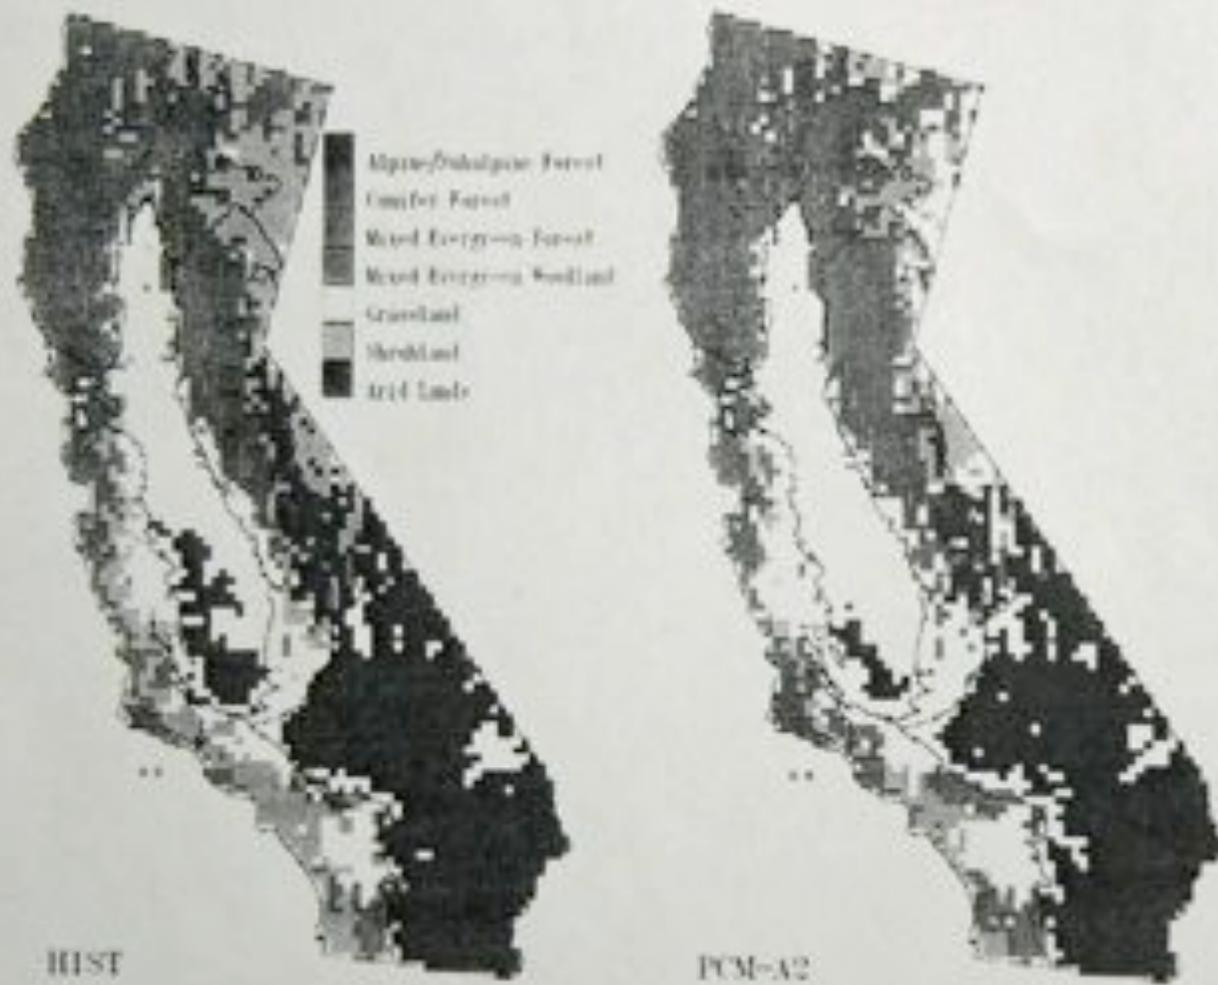

Figure 1. Distribution of the vegetation classes simulated for the historical (1961–1990) and PCM-A2 future period (2070–2099). The vegetation class mapped at each grid cell is the most frequent class simulated during the time period.
