

Coastal California Vegetables: Pathology Update

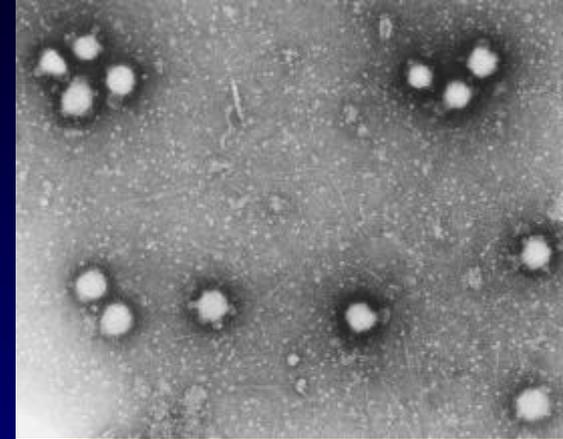

**Steven Koike
University of California
Cooperative Extension**

Virus diseases of plants

- **Difficult to diagnose:**
 - **Overlapping symptoms: many viruses**
 - **Overlapping symptoms: other problems**
 - **No visual signs of the pathogen**
 - **Symptoms are variable**
 - **Age of plant when infected**
 - **Crop cultivar**
 - **Time of year or weather conditions**
 - **Strain of the virus**
 - **Multiple viruses can infect the same plant**
 - **Most tests are serological / molecular**

Virus diseases of plants

- **Complex systems**
 - Host plant
 - Virus pathogen
 - Vector that spreads the virus
 - Alternate hosts
 - Other crops
 - Weeds and surrounding vegetation
 - Over-wintering hosts
 - Source of primary inoculum: seed, vegetative propagation, alternate hosts, (soil)

Virus diseases in 2015

- **Why? Vector dynamics:**
 - Mild winter
 - Warm spring
 - Little rain: early dry down of hill vegetation
- **Which crops?**
 - Lettuce, spinach, Brussels sprouts, cauliflower, Swiss chard, beet, cilantro, radicchio, tomato
- **Which viruses?**
 - CMV, INSV, TSWV, LMV, AMV, BCTV, BWYV

**Cucumber
mosaic virus**

Cucumber mosaic virus

Cucumber mosaic virus

Lettuce mosaic virus

Alfalfa mosaic virus

Impatiens necrotic spot virus

Tomato spotted wilt virus

Beet curly top virus and/or Beet western yellows virus

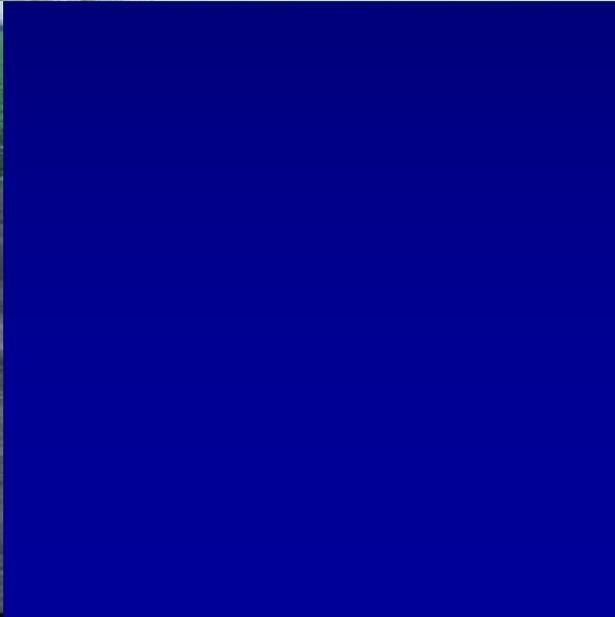

**Cucumber mosaic virus
and
Tomato spotted wilt virus**

Virus diseases of plants

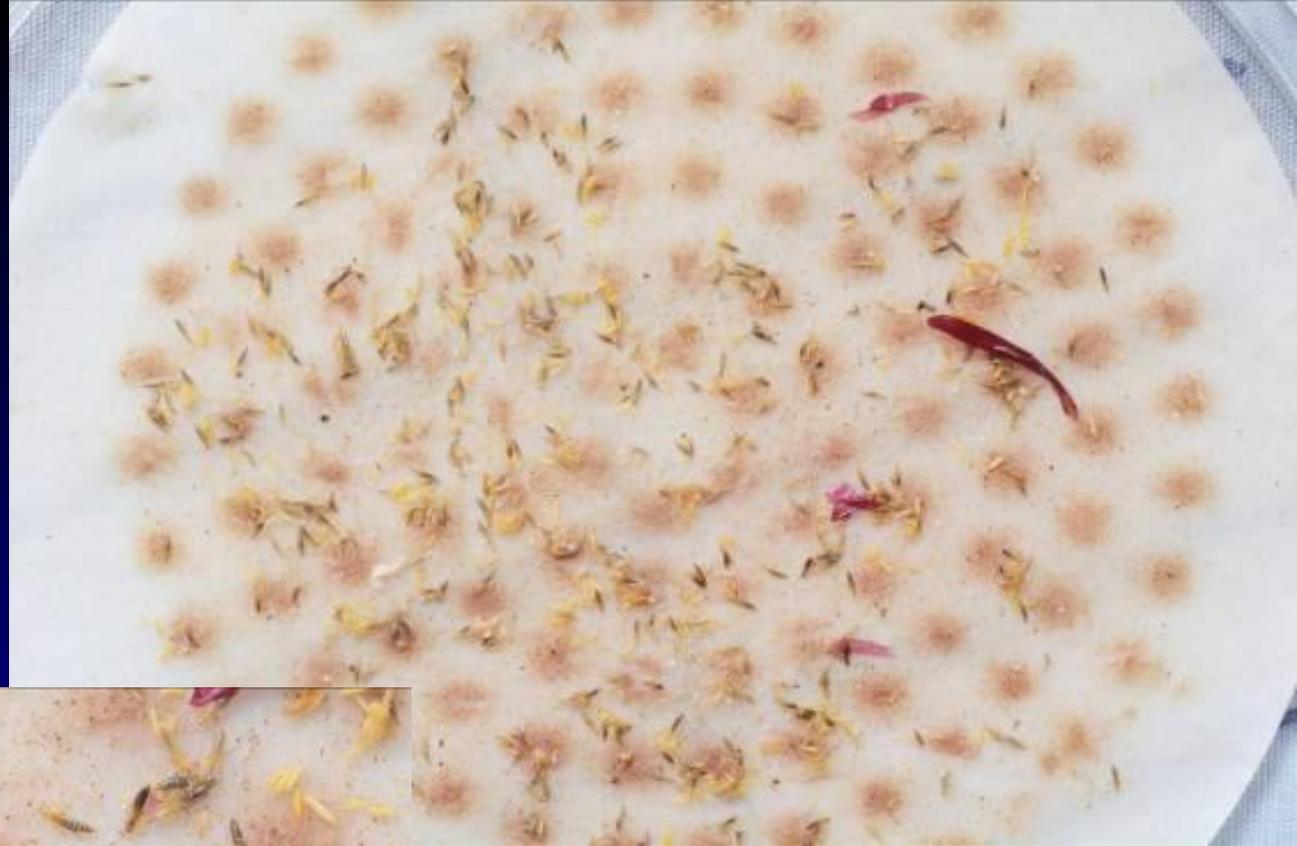

- **Management:**
 - **Host plant:**
 - resistant cultivars, site selection, crop rotation
 - **Vector:**
 - insecticides*, site selection, IPM
 - **Alternate hosts:**
 - weed control, site selection, crop rotation, host-free periods

*** Insecticides do not completely prevent infection.**

20 iceplant flowers/sample
sample average: 363 adults
664 juveniles
51 total thrips per flower

Phoma

Ramularia

Alternaria

Alternaria species from cilantro
