

Project Title: UC Division of Agriculture and Natural Resources Statewide Processing Tomato Variety Evaluation Trials, 2001

Project Leaders:

Mike Murray Farm Advisor & County Director UCCE, Colusa County P. O. Box 180 Colusa, CA 95932 (530) 458-0577 mmurray@ucdavis.edu	Michael Cahn Farm Advisor UCCE, Sutter & Yuba Counties 142-A Garden Highway Yuba City, CA 96991 (530) 822-7515 mdcahn@ucdavis.edu
---	---

Cooperating DANR Personnel:

Diane Barrett, Food Science & Technology CE Specialist, UCD
Janet Caprile, Farm Advisor, Contra Costa County
Tim Hartz, Vegetable Crops CE Specialist, UCD
Don May, Farm Advisor, Fresno County (emeritus)
Gene Miyao, Farm Advisor, Yolo, Solano & Sacramento Counties
Bob Mullen, Farm Advisor, San Joaquin County
Joe Nunez, Farm Advisor, Kern County
Scott Stoddard, Staff Research Associate, Merced County
Jesús Valencia, Farm advisor, Stanislaus County
Bill Weir, Farm Advisor, Merced & Madera Counties

Summary:

Four early- and 11 mid-maturity variety tests were conducted throughout major processing tomato production regions of California during the 2001 season. An additional mid-maturity test (Merced County) was lost due to sustained adverse environmental conditions. All of the major production areas, from Kern to Sutter/Colusa Counties, had one or more field tests to identify tomato cultivars appropriate for that specific region.

Increasing industry interest in the use of transplants has led us to incorporate this production technique into our variety evaluation program, where appropriate. Three of the mid-season test sites (Colusa, San Joaquin and Yolo Counties) utilized transplants. Two of the locations conducted both direct-seeded and transplant mid-season tests.

The highest yielding early- maturing replicated varieties were CXD 216, PS 816, UG 606, H 1100 and 'APT 410', across all locations. The overall highest yielding mid-maturing replicated varieties were H9665, H9492, H9775, and H8892.

Objectives:

The objectives have remained the same since this program was initiated over 25 years ago: to conduct well-designed, replicated varietal performance field tests throughout major California processing tomato production regions. The primary way of accomplishing that is the evaluation of recently-developed and industry standard cultivars. Parameters of particular interest include fruit quality (soluble solids, pH and color), fruit yields, disease resistance/tolerance and plant architecture. These tests are designed and conducted with input or collaboration from seed companies, processors, producers and other industry partners, and are intended to generate information useful for making intelligent variety selection management decisions.

Procedures:

Tests were established in commercial production fields with grower cooperators. A uniform set of varieties was used at all locations, and individual Farm Advisors had the latitude to add to this core-group, to meet specific local needs. The tests included 9 observational & 12 replicated early-maturity entries and 19 observational & 19 replicated entries in the mid-maturity tests (Tables 1A and 1B).

Early-maturing tests were planted from January to the end of March and mid-maturity tests were planted from April to early June. New varieties usually were screened one or more years in non-replicated, observational tests before being selected for testing in replicated trials. Tests are established in commercial production fields with grower cooperators. A common set of varieties are utilized in all of the tests, and individual Farm Advisors have the latitude to add to this core-group, to meet specific local unique needs.

Each variety is planted in a one-bed wide by 100 foot long plot. The replicated varieties are planted in four randomly selected plots and the observational varieties in one non-replicated plot. The plots are seeded/transplanted by the researcher, separately from the remainder of the field outside of the test area. All cultural operations, with the exception of planting and harvesting, are done by the grower/cooperator and are consistent with what is done to the remainder of the field outside of the test area.

All variety trials were furrow irrigated with the exception of the 3rd Fresno County mid-season maturing trial, which was subsurface drip irrigated, and the Sutter and Colusa County, mid-season maturing trials, which were sprinkler irrigated. Colusa, San Joaquin, and Stanislaus County mid-season maturing trials received an application of Ethrel to hasten ripening.

A field day, or arrangements for interested persons to visit the plots, occurred at all of the tests. Shortly before or during harvest, fruit samples were collected from all plots and submitted to PTAB for soluble solids, color and pH determinations.

The plots were harvested with commercial harvesters (except the San Joaquin trial and the early trial at the Westside Field Station in Fresno), using GT wagons, equipped with weigh cells, to obtain plot weights.

The data were statistically analyzed using analysis of variance procedures and reports of results were disseminated to the California processing tomato industry through individual newsletters, regional production meetings, CTRI Director meetings, media and other methods.

Results:

Results are presented in the following tables for the combination of all locations and for individual trials:

Table 2: A, B, C, D Early-Maturity Observational—Yield, Soluble solids, PTAB Color, pH

Table 3: A, B, C, D Early-Maturity Replicated— Yield, Soluble solids, PTAB Color, pH

Table 4: A, B, C, D Mid-Maturity Observational—Yield, Soluble solids, PTAB Color, pH

Table 5: A, B, C, D Mid-Maturity Replicated—Yield, Soluble solids, PTAB Color, pH

Early-Maturing Observational Varieties

The average fruit yield of all observational varieties across the 4 trial locations was 36.9 tons/acre. Yields were not significantly different among varieties (Table 2A), although there was an 11 ton/acre difference between the highest and lowest yields.

The average soluble solids level across all locations and varieties was 4.9%. The varieties with the highest brix levels were 'NDM970', 'CTRI1090' and 'HyPeel 45' (Table 2B).

Varieties with the lowest PTAB color were 'H1800', and 'H9997' (Table 2C). The average PTAB color across locations/varieties was 24.7.

Fruit pH levels were not significantly different between observational varieties (Table 2D). The average fruit pH for all locations and varieties was 4.36.

Early-Maturing Replicated Varieties

The average fruit yield for all replicated varieties across the 4 trial locations was 37.9 tons/acre. Highest yielding varieties included 'CXD 216', 'PS816', 'UG606', 'H1100' and 'APT 410' (Table 3A). Note that there was a significant interaction among varieties and locations, meaning that the relative ranking of varieties differed significantly among locations.

The average soluble solids level across locations and varieties was 5.0%. The varieties with the highest brix levels were 'H9888', 'CTRI1056' and 'HyPeel 45'(Table 3B). Brix levels were consistent between locations.

Varieties with the lowest PTAB color were 'APT410', 'H9280', 'H9888', 'CTRI1056' and 'Hypack 280' (Table 3C). Fruit color averaged 25.1 across all varieties and locations.

Varieties with the lowest fruit pH were 'H9881' and 'CTRI1056'(Table 3D). The average fruit pH for all locations and varieties was 4.37. pH was not measured at the Fresno location.

Mid-Maturity Observational Varieties

Yield data from observational varieties were analyzed for 10 locations. Kern County yields were not included in the analysis due to high variability. In addition PTAB data was unavailable for Kern County. The average fruit yield for all observational varieties across the 10 trial locations was 41.9 tons/acre. The highest yielding varieties were 'Sun 6340' and 'AP863'(Table 4A).

The average brix level across all locations and varieties was 5.2%. The varieties with the highest brix levels were 'CTRI1056', 'PS173', 'Sun 6324', 'SUN 6333', 'CXD211', 'CDX224' and 'H9995' (Table 4B).

Twelve of the 19 varieties were in the lowest PTAB color group(Table 4C). The average across locations and varieties was 23.9.

Varieties with the lowest pH were 'PX849', 'CTRI1056', 'H9995', 'Sun 6340', and 'Sun 6333' (Table 4D). The average fruit pH for all locations and varieties was 4.34.

Mid-Maturity Replicated Varieties

The average fruit yield for all replicated varieties across the 11 trial locations was 38.2 tons/acre. The highest yielding varieties were 'H9665', 'H9492', 'H9775', and 'H8892' (Table 5A). There was a significant variety by location interaction, meaning that the relative ranking of varieties differed among locations.

The average soluble solids level across all locations and varieties was 5.2%. The variety with the highest brix level was 'CXD 221' (Table 5B). A significant variety times location interaction was found for fruit brix.

The variety with the lowest PTAB color was 'CXD 207' (Table 5C). The average PTAB color across locations and varieties was 23.8.

Varieties with the lowest fruit pH were 'H9665', 'Halley 3155', 'H9775' and 'HyPeel 347' (Table 5D). The average fruit pH for all locations and varieties was 4.33.

Acknowledgements:

We thank the CTRI and participating seed companies for continued support. We appreciate PTAB's cooperation and evaluation of our fruit samples. We could not conduct these tests without the ongoing support of the processors. We rely heavily on the statistical expertise of Gail Nishimoto. We thank the many grower cooperators who were involved with these trials: Button and Turkovich Ranches, Crettol Farms, Emerald Farms, Live Oak Farms, Marca Bella Farms, J.H. Meek and Sons, Michelena Farms, Joe Muller and Sons, Poundstone Brothers, Roma Farms, and Simoni and Massoni Farms.
