

Powdery Mildew Control in Tomatoes

Brenna Aegerter
Michelle Le Strange
Gene Miyao
Scott Stoddard
Tom Turini

University of California
Cooperative Extension

Symptoms

Yellow spots
with or without
visible
sporulation

Symptoms

Sometimes
profuse
sporulation

Necrosis

2011 CTRI-funded trials evaluating spray program timings and materials

- Three trials in commercial fields (Winters, Tracy and Los Banos areas)
- Two trials on-station (West Side Research and Extension Center & UCD campus)
- All trials transplanted in May, harvested in Sept.
- All trials (except Winters-area trial) were with variety SUN6366 or SUN6368
- Powdery mildew developed at two locations

2011 CTRI trials evaluating spray program timings and materials

- Quadris Top alternated with dust sulfur - 7 day interval (July & August)
- Quadris Top alt. sulfur – as above but 14 day interval
- Quadris Top alt. sulfur – 7 day - late start at ~6 weeks before harvest (Aug)
- Quadris Top alt. sulfur – 7 day – early start but ending about 6 weeks before harvest (July)
- Sulfur dust – 7 day (July- August)
- Sulfur dust – 14 day (July- August)
- Wettable sulfur – 14 day (July- August)
- Non-treated control – no mildew fungicides

Field Trial Methods

- Fungicides applied with CO₂ backpack sprayer and a hand-held boom (32 to 40 psi)
- Sulfur dust applied with hand-crank operated duster
- Plots consisted of a single bed by 50 (to 75 feet) – with one buffer row between treated rows – plots replicated four times
- Plots evaluated for:
 - Percent of foliage affected by mildew
 - Percent necrosis at end of season
 - Fruit yield and maturity
 - Fruit quality (sunburn, color, soluble solids, pH)

WSREC trial, Five Points;

Chemical control

Many registered materials are effective, but sulfur dust is one of the best treatments, as are Quadris Top (strobilurin/11 plus DMI/3), and Quadris (strobilurin/11)

Several promising materials in four new/different chemical classes (not yet registered for tomato)

Conclusions

Disease increasing one month prior to harvest may affect soluble solids (Brix) without affecting yield; earlier high disease pressure may significantly reduce yields

Preventative applications are needed, 2-week treatment interval may be too long when disease pressure is high?

Young plants appear less susceptible

Thank you!
