

IPM: Cereal Rust Problems – Resistance, Susceptibility, and Management

Hay Days Workshop

March 1, 2019, Morgan Hill at Tilton Ranch

Nick Clark – Agronomy & Nutrient Mgmt. Farm Advisor, Fresno, Kings, & Tulare Counties

(559) 852-2788

neclark@ucdavis.edu

Presentation Outline

- Plant Disease
- Rust pathogens, disease cycle
- Rust management strategies
- Variety selection tool
- Conclusion

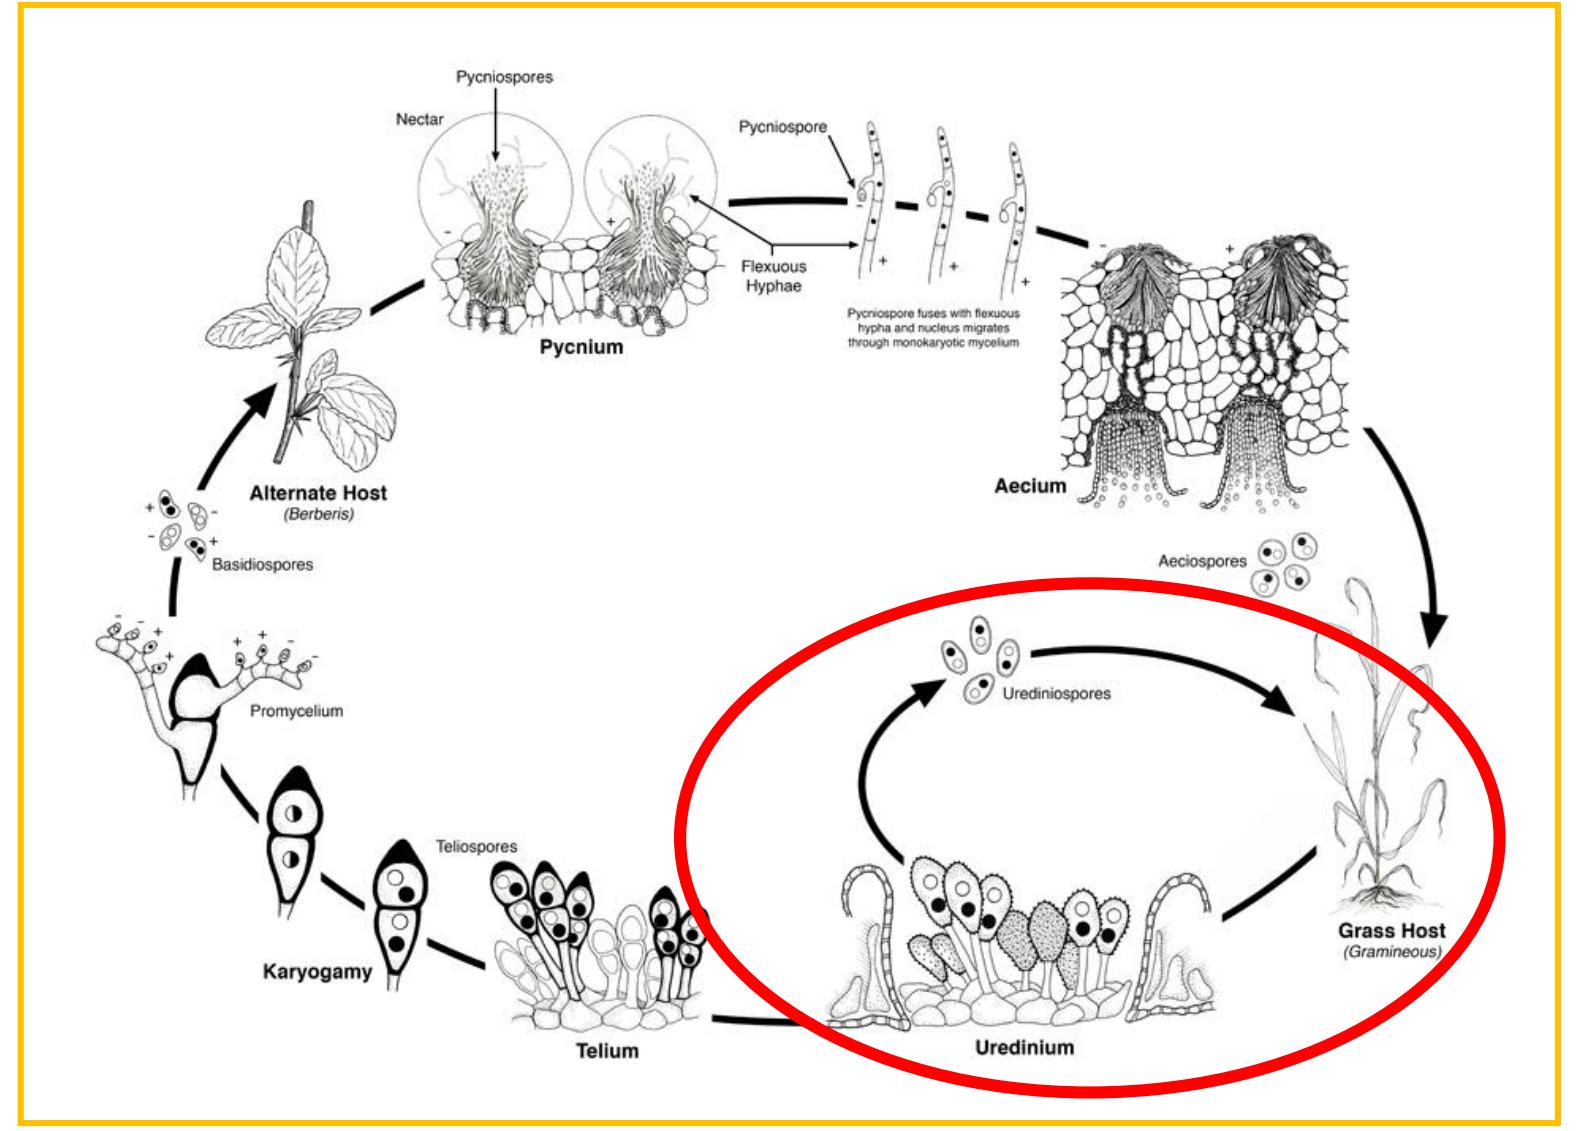

Plant Disease

- Diminished capacity to function normally;
 - Biotic and abiotic causes

Rust Diseases

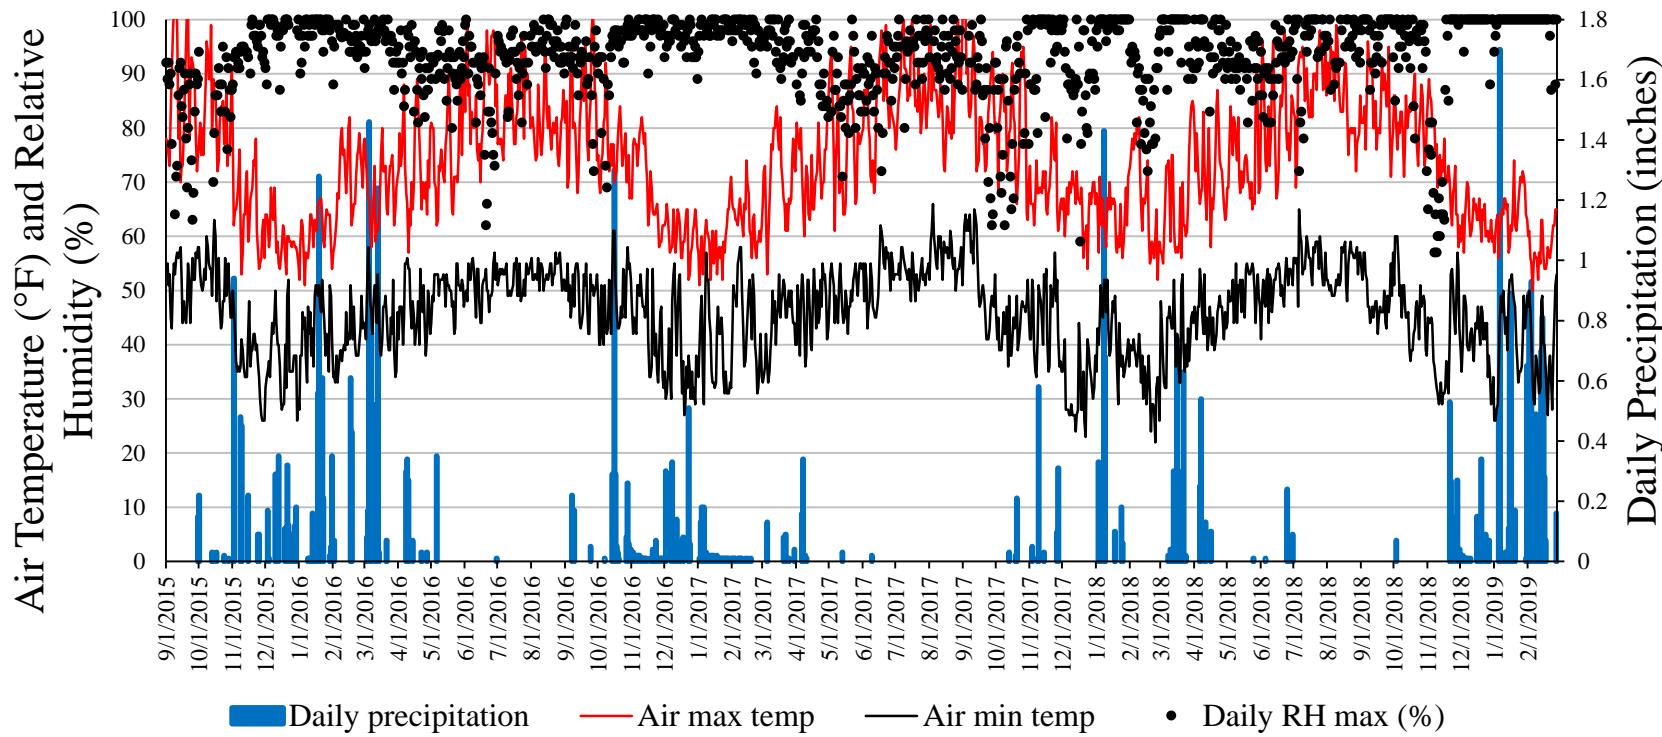

- Caused by pathogens
 - *Puccinia spp.*
- Obligate parasites
- Host species specific
- Stem, crown, leaf, stripe
 - All different pathogens
- Alternate hosts usually not important

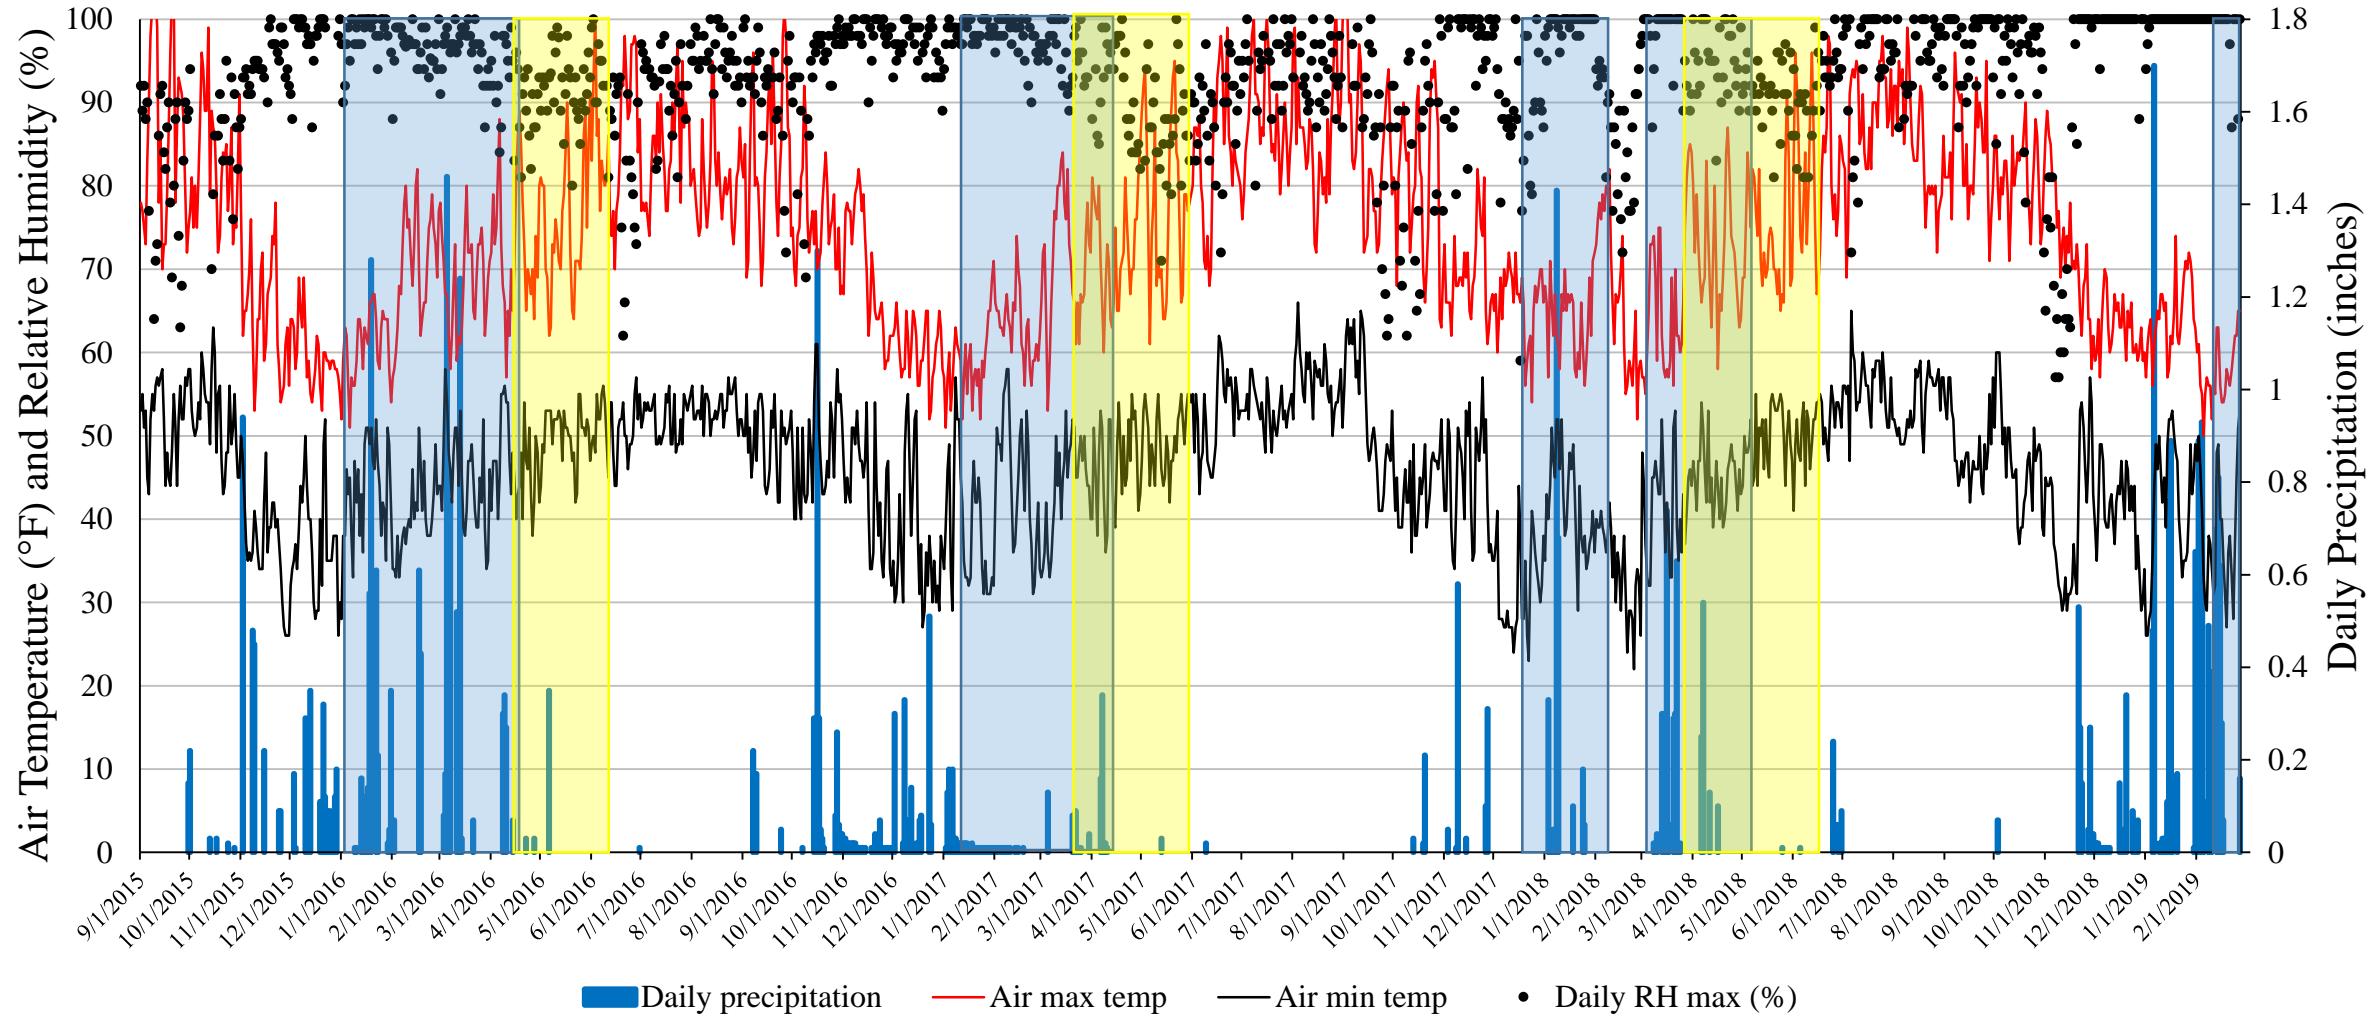

Favorable Environments

- Leaf Rusts
 - 60-86 °F
 - Frequent dew or high RH%
- Stem Rusts
 - 60-86 °F
 - Frequent dew or high RH%
- Strip Rust
 - 50-64 °F
 - Frequent dew or high RH%

Temperature, Relative Humidity, and Precipitation at Gilroy
CIMIS, 9/1/15 to Present

Agriculture and Natural Resources

Management of Rust

- Establishing/maintaining healthy plants
- Planting of resistant varieties
- Planting blends of species
- Disease favorable environment forecasting
- Well-timed application of fungicides
 - Strobularins or triazoles to protect the flag leaf

Summary

- Plant disease requires the convergence in the same place at the same time of a susceptible host, enough of a virulent pathogen, and the favorable environmental conditions for disease development (infection, growth, dispersion).
- Small grains rust diseases can largely be controlled by selection of resistance varieties and species coupled with well-timed fungicide applications in high disease pressure years or for susceptible varieties to protect the flag leaf.
- A dynamic, interactive web-tool is available to assist in the selection of small grain varieties for irrigated and dryland systems based on a number of agronomic and disease resistance factors.

Thank You
