Ascochyta Blight of Garbanzo Detected in Five Points/Lemoore Area of Fresno and Kings Counties. What Now?

Tom Turini & Nick Clark

Between the 22nd and 27th of February, Ascochyta blight in garbanzo beans was detected in the Five Points/Lemoore area.

This disease has potential to cause economic damage, is favored by wet conditions and moderate temperatures, and rain is in the forecast for Friday, March 1st and Sunday, March 3rd.

Fungicides, such as Endura (boscalid), Headline (pyraclostrobin), or Quadris (azoxystrobin) applied to garbanzo foliage preventatively will reduce risk of loss due to this disease.

Consult product labels carefully before applying a fungicide treatment to ensure the most effective application method, timing and rate.

Here are recent resources for more information about Ascochyta blight in garbanzos:
